14 REVISION HISTORY	193

1 GENERAL DESCRIPTION

The ST7796DW is a single-chip controller/driver for 16.7M-color, graphic type TFT-LCD. The 320-channel source driver has true 8-bit resolution, which generates 64 Gamma-corrected values by an internal D/A converter. The ST7796DW is capable of connecting directly to an external microprocessor, and provides MIPI interface. In addition, because of the integrated power supply circuit necessary to drive liquid crystal; it is possible to make a display system with fewest components.

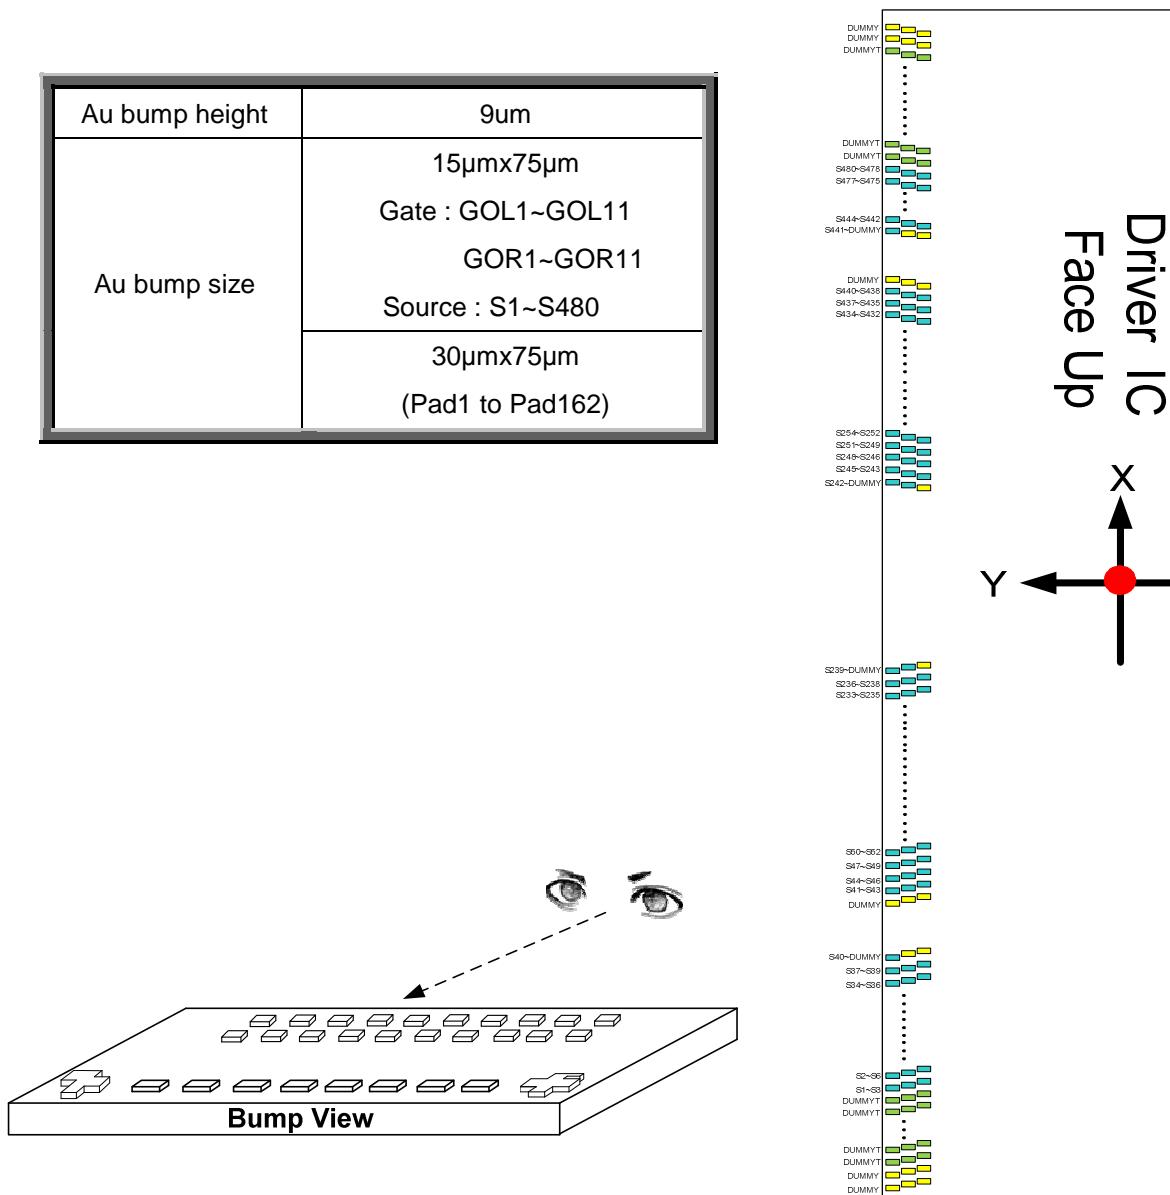

2 FEATURES

- Single chip TFT-LCD Controller/Driver without Display RAM
- Display Resolution:
 - 320*RGB (H) *320(V)
 - 280*RGB (H) *280(V)
 - 240*RGB (H) *240(V)
 - 128*RGB (H) *128(V)
- LCD Driver Output Circuits
 - Source Outputs: 320 RGB Channels
 - Support gate control signals to gate driver in the panel
- Display Colors (Color Mode)
 - Idle Mode: 8-colors
 - 2-color idle mode (1-bpp RAM) (Picture maximum compression size < 4k bytes)
- Programmable Pixel Color Format (Color Depth) for Various Display Data Input Format
 - 16-bit/pixel: RGB=(565) 65K color
 - 18-bit/pixel: RGB=(666) 262K color
 - 24-bit/pixel: RGB=(888) 16.7M color
- Interface
 - MIPI Video Mode
- Display Features
 - 1Gamma (64 gray levels)
 - SRE Function (enhancement CR)
- On Chip Build-In Circuits
 - DC/DC Converter
 - Non-Volatile (NV) Memory to Store Initial Register Setting and Factory Default Value (Module ID, Module Version, etc)
 - Adjustable VCOM Generation
 - Timing Controller
- Build-In NV Memory for LCD Initial Register Setting
 - OTP to store VCOM and ID1~ID3
- Driving Algorithm
 - 1-dot/2-dot Inversion
 - Column Inversion

- Wide Supply Voltage Range
 - I/O Voltage (VDDI to DGND): 1.65V ~ 3.3V ($VDDI \leq VDD$)
In VCCBYPASS Mode: $VDDI=1.8v$
 - Voltage for Digital Circuit (VDD to DGND): 2.6V ~ 3.3V
 - Voltage for Analog Circuit (VDDA to AGND): 2.6V ~ 3.3V
- On-Chip Power System
 - VCOM Level: AGND
- COG Type
 - 3 Stagger 11um
- Operate temperature range: -30°C to +85 °C
- Power saving modes
 - Deep standby mode
 - Sleep mode
 - Low frame mode 15Hz
- Output Power
 - Gamma(+) voltage range: 3.6V~6.6V
 - Gamma(-) voltage range:-4.2V~-1.6V
 - VGHO voltage range:12.6V~15.5V
 - VGLO voltage range:-8.3V~-11.8V
- Others
 - Zero-Cap
 - GIP+Dual-gate driving
 - OTP
 - The Source number must be a multiple of 8
 - The Gate number must be a multiple of 2
 - In Bust Mode, H-Porch must be had blanking

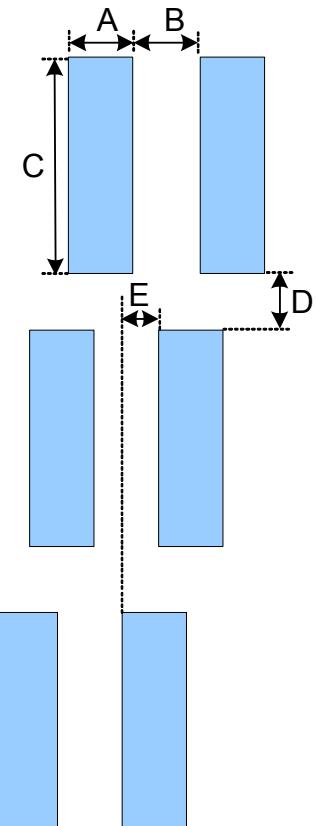

3 PAD ARRANGEMENT

3.1 Output Bump Dimension

3.2 Bump Dimension

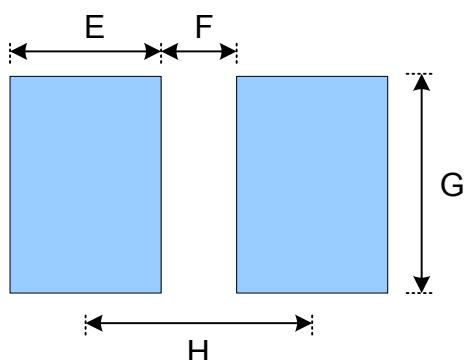

●Output Pads

Symbol	Item	Size
A	Bump Width	15 um
B	Bump Gap 1 (Horizontal)	18 um
C	Bump Height	75 um
D	Bump Gap 2 (Vertical)	25 um
E	Bump Pitch	11um

●Input Pads

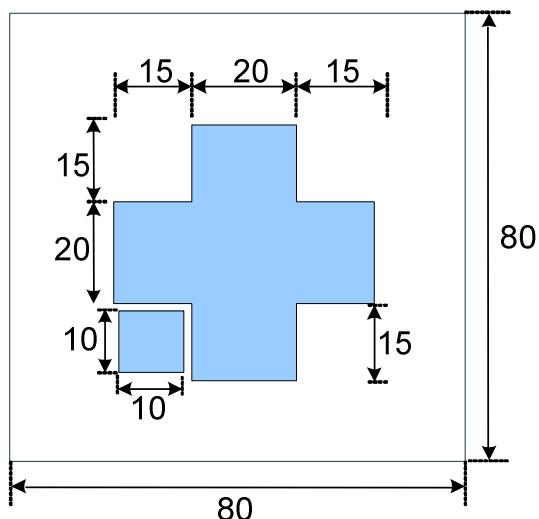

Pad No.1~162

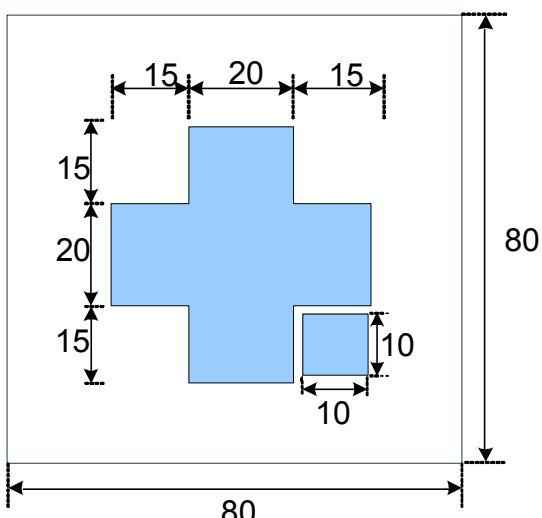

Symbol	Item	Size
E	Bump Width	30 um
F	Bump Gap	15 um
G	Bump Height	75 um
H	Bump Pitch	45 um

3.3 Alignment Mark Dimension

- Alignment Mark Left: L(X,Y)=(-3707, -352)

- Alignment Mark Right: R(X,Y)= (3707, -352)

3.4 Chip Information

Chip size	7600um x 900um
Chip thickness	250um
Pad Location	Pad center
Coordinate Origin	Chip center

5 BLOCK DIAGRAM

6 PIN DESCRIPTION

6.1 Power Supply Pins

Name	I/O	Description	Connect Pin
VDDI	I	- Power supply for I/O system. - VDDI must be lower than or equal to VDD.	VDDI
VDDA	I	- Power supply for analog and booster circuits. Input voltage level should be the same as VCI.	VCI
VDDM	I	- Power supply for MIPI circuits. Input voltage level should be the same as VCI.	VCI
VDDR	I	- Power supply for Gamma circuits . Input voltage level should be the same as VCI.	VCI
AGND	I	- System ground for analog system and booster circuit.	GND
AGNDR	I	- System ground for Gamma circuit.	GND
DGND	I	- System ground for I/O system and digital system.	GND
VPP	I	- Power supply for internal NVM. - Writing NVM needs external power supply voltage with 7.5V. - The current of Ivpp must be more than 10mA. - Leaves these pins open if not used.	External Power

6.2. Interface Logic Pins

Name	I/O	Description	Connect Pin
IMP	I	-The MCU interface mode select. -Only MIPI.	GND
RESXP	I	- This signal will reset the device and it must be applied to properly initialize the chip. - Signal is active low.	MCU
MIPI_CLK_P	I	-Positive polarity of low voltage differential clock signal.	MIPI
MIPI_CLK_N	I	-Negative polarity of low voltage differential clock signal.	MIPI
MIPI_DATA_P	I/O	-Positive polarity of low voltage differential data signal.	MIPI
MIPI_DATA_N	I/O	-Negative polarity of low voltage differential data signal.	MIPI
TEP	O	- Tearing effect output. - If not used, leave this pin open.	MCU

CSWP DSWP	I	Differential clock polarity swap. For MIPI interface.						VDDI/DGND
		CSWAP	DSWAP	CLK_P	CLK_N	D0_P	D0_N	
		0	0	CLK_N	CLK_P	D0_N	D0_P	
			1	CLK_N	CLK_P	D0_P	D0_N	
		1	0	CLK_P	CLK_N	D0_N	D0_P	
			1	CLK_P	CLK_N	D0_P	D0_N	

6.3. Driver Output Pins

Name	I/O	Description	Connect pin
S[1:480]	O	Source output voltage signals applied to liquid crystal.	LCD
GOR[1:11] GOL[1:11]	O	Gate control signals and the swing voltage level is VGHO to VGLO.	LCD
VGH	O	- Power output pin for gate driver. - Leave open when not in use.	LCD
VGL	O	- Power output (Negative) pin for gate driver. - Leave open when not in use.	LCD
VGHS	O	- Power output pin for gate driver. (pump). - Leave open when not in use.	LCD

6.4. Test and Other Pins

Name	I/O	Description	Connect pin
Dummy	-	- These pins are dummy. - Leave the pin open.	OPEN
Dummty	-	- These pins are dummy. - Leave the pin open.	OPEN
OSCP	I/O	- This pin is for testing. - Leave the pin open.	OPEN
HSTRIM	O	- This pin is for testing. - Leave the pin open.	OPEN
VCCM	O	-Used for monitoring. - Leave the pin open.	OPEN

VCCLP	O	Used for monitoring. - Leave the pin open.	OPEN
TSEL[0:2]	I	- This pin is for testing - Leave the pin open.	OPEN
SVEE	O	-Used for monitoring. - Leave the pin open.	OPEN
SVDD	O	-Used for monitoring. - Leave the pin open.	OPEN
VCC	O	-Used for monitoring. - Leave the pin open.	OPEN
AVDD	O	-Power Pad for analog Circuit. - Leave the pin open.	OPEN
AVEE	O	-Power Pad for analog Circuit. - Leave the pin open.	OPEN
VAPP	O	-A power output of grayscale voltage. - Leave the pin open.	OPEN
VANP	O	-A power output (negative) of gray scale voltage. - Leave the pin open.	OPEN
VAG	O	- This pin is for testing. - Leave the pin open.	OPEN
V22P	O	-Used for monitoring. - Leave the pin open.	OPEN
ATS0	O	- This pin is for testing. - Leave the pin open.	OPEN
TEST[0:7]	O	- This pin is for testing - Leave the pin open.	OPEN

7. DRIVER ELECTRICAL CHARACTERISTICS

7.1. Absolute Operation Range

Item	Symbol	Range	Unit
Supply Voltage (Analog)	V _{CI}	- 0.3 ~ +4.6	V
Supply Voltage (I/O)	V _{DDI}	- 0.3 ~ +4.6	V
Supply Voltage (Logic)	V _C	-0.3 ~ +2	V
Driver Supply Voltage	V _{GH} -V _{GL}	-0.3 ~ +30.0	V
Logic Input Voltage Range	V _{IN}	0.5 ~ V _{DDI} + 0.5	V
Logic Output Voltage Range	V _O	0.5 ~ V _{DDI} + 0.5	V
Operating Temperature Range	T _{OPR}	-30 ~ +85	°C
Storage Temperature Range	T _{TSG}	-40 ~ +125	°C

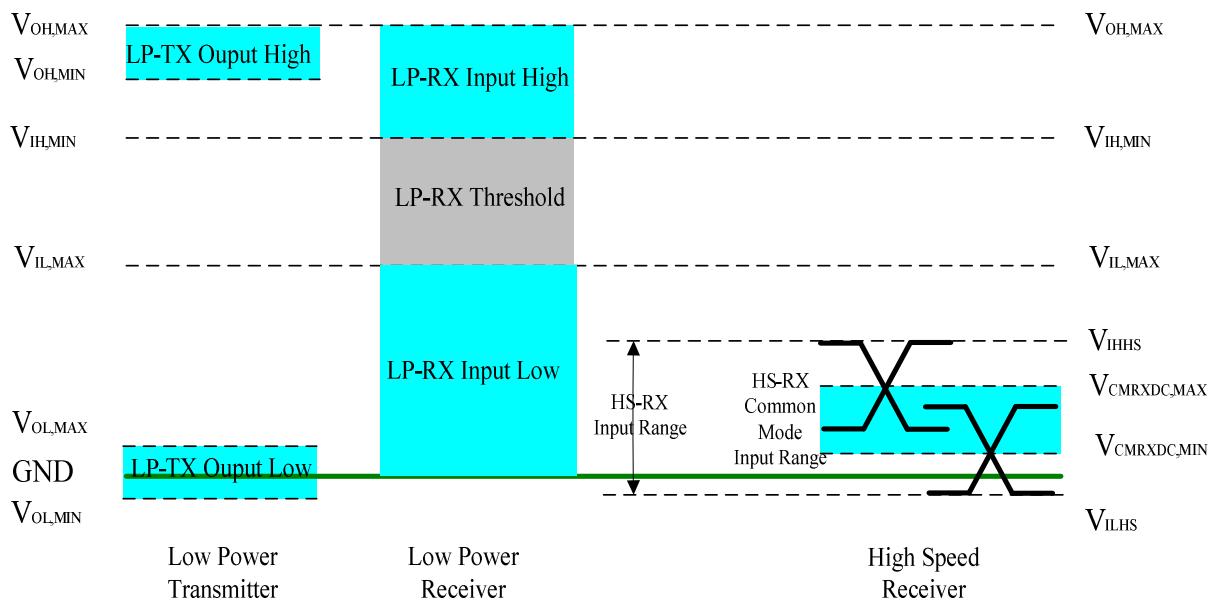

Absolute Operation Range

Note: If one of the above items is exceeded its maximum limitation momentarily, the quality of the product may be degraded. Absolute maximum limitation, therefore, specify the values exceeding which the product may be physically damaged. Be sure to use the product within the recommend range.

7.2. DC Characteristics

7.2.1. DC characteristics for MIPI DSI

- MIPI Signaling Voltage Levels

- MIPI DC characteristics

Parameter	Symbol	Specification			Unit
		MIN	TYP	MAX	
Operation Voltage for MIPI Receiver					
Low power mode operating voltage	VLPH	1.1	1.2	1.3	V
MIPI Characteristics for High Speed Receiver					
Single-ended input low voltage	VILHS	-40	-	-	mV
Single-ended input high voltage	VIHHS	-	-	460	mV
Common-mode voltage	VCMRXDC	70	-	330	mV
Differential input impedance	ZID	80	100	125	ohm
MIPI Characteristics for Low Power Mode					
Pad signal voltage range	VI	-50	-	1350	mV
Logic 0 input threshold	VIL	0	-	550	mV
Logic 1 input threshold	VIH	88 0	-	-	mV
Output low level	VOL	-50	-	50	mV
Output high level	VOH	1.1	1.2	1.3	V

7.2.2. DC Characteristics for Panel Driving

Parameter	Symbol	Condition	Specification			Unit	Related Pins
			MIN.	TYP.	MAX.		
Power & Operation Voltage							
System Voltage	VDD / VDDA	Operating voltage	2.5	2.75	3.3	V	-
Interface Operation Voltage	VDDI	I/O Supply Voltage	1.65	1.8	3.3	V	-
Gate Driver High Voltage	VGH	-	12.6	-	15.5	V	-
Gate Driver Low Voltage	VGL	-	-11.8	-	-8.3	V	-
Gate Driver Supply Voltage	-	VGH-VGL	-	-	27.3	V	-
Input / Output							
Logic-High Input Voltage	VIH	-	0.7VDDI	-	VDDI	V	Note 1
Logic-Low Input Voltage	VIL	-	VSS	-	0.3VDDI	V	Note 1
Differential Input High	VIT+	-	-	0	50	mV	MIPI_CLK,

Threshold Voltage							MIPI_DATA
Differential Input Low Threshold Voltage	VIT-	-	-50	0	-	mV	
Single-ended Receiver Input Operation Voltage Range	VIR	-	0.5	-	1.2	V	
Logic-High Output Voltage	VOH	IOH = -1.0mA	0.8VDDI	-	VDDI	V	Note 1
Logic-Low Output Voltage	VOL	IOL = +1.0mA	VSS	-	0.2VDDI	V	Note 1
Logic-High Input Current	IIH	VIN = VDDI	-	-	1	uA	Note 1
Logic-Low Input Current	IIL	VIN = VSS	-1	-	-	uA	Note 1
Input Leakage Current	ILI	IOH = -1.0mA	-0.1	-	+0.1	uA	Note 1
VCOM Voltage							
VCOM Voltage	VCOM	-	-	VSS	-	V	-
Source Driver							
Gamma Reference Voltage(Positive)	VAP	-	3.6	-	6.6	V	-
Gamma Reference Voltage(Negative)	VAN	-	-4.2	-	-1.6	-	-
Source Output Settling Time	Tr	Below with 99% precision	-	-	20	us	Note 2
Output Offset Voltage	VOFFSET	-	-	-	35	mV	Note 3

Basic DC Characteristics

Notes:

1. TA= -30 to 85°C.
2. The max. value is between measured point of source output and gamma setting value.

7.3. Power Consumption

$T_a=25^\circ\text{C}$, Frame rate = 30Hz, Registers setting are IC default setting.

Operation Mode	Image	Current Consumption			
		Typical		Maximum	
		IDDI (mA)	IDD (mA)	IDDI (mA)	IDD (mA)
Normal Mode	Note	1.97	6.03	0.078	8.12
Slpin Mode	Note	0	0.037	0	0.055
Stand by Mode	Note	0	0	0	0

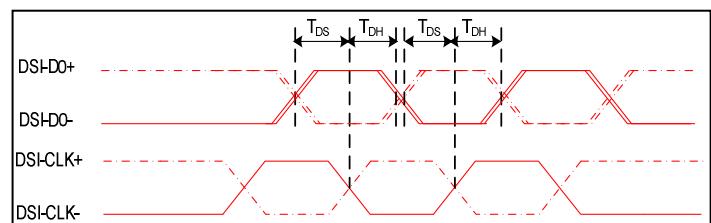

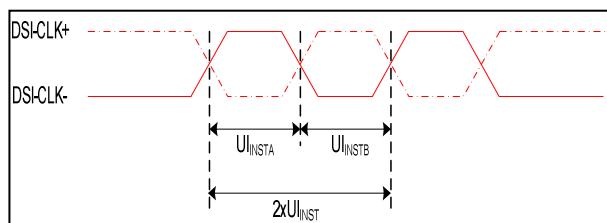

Notes:

1. Color Picture.
2. The Current Consumption is DC characteristics of ST7796DW.
3. Typical: $VDDI=1.8\text{V}$, $VCI=2.8\text{V}$; Maximum: $VDDI=3.3\text{V}$, $VCI=3.3\text{V}$
4. Maximum can not be used VCCM/VCC Bypass

7.4. MIPI Interface Characteristics

7.4.1. High Speed Mode

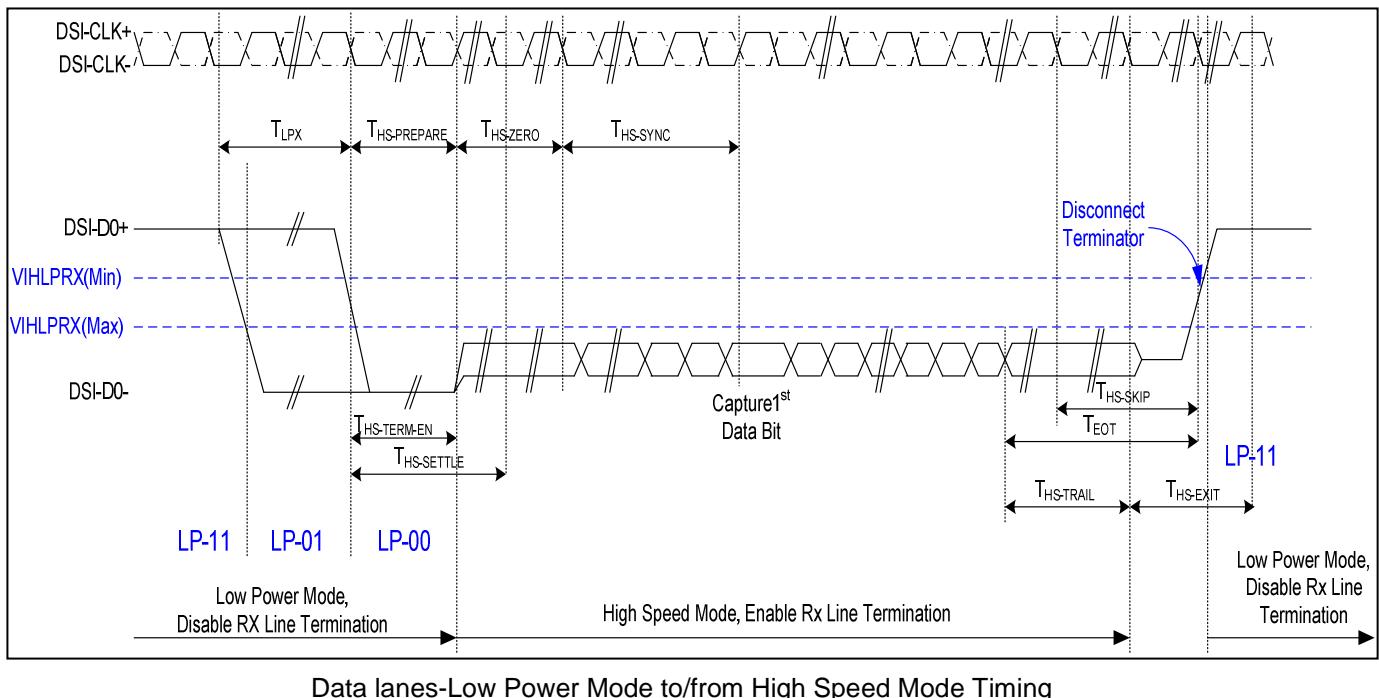

- Clock Channel Timing

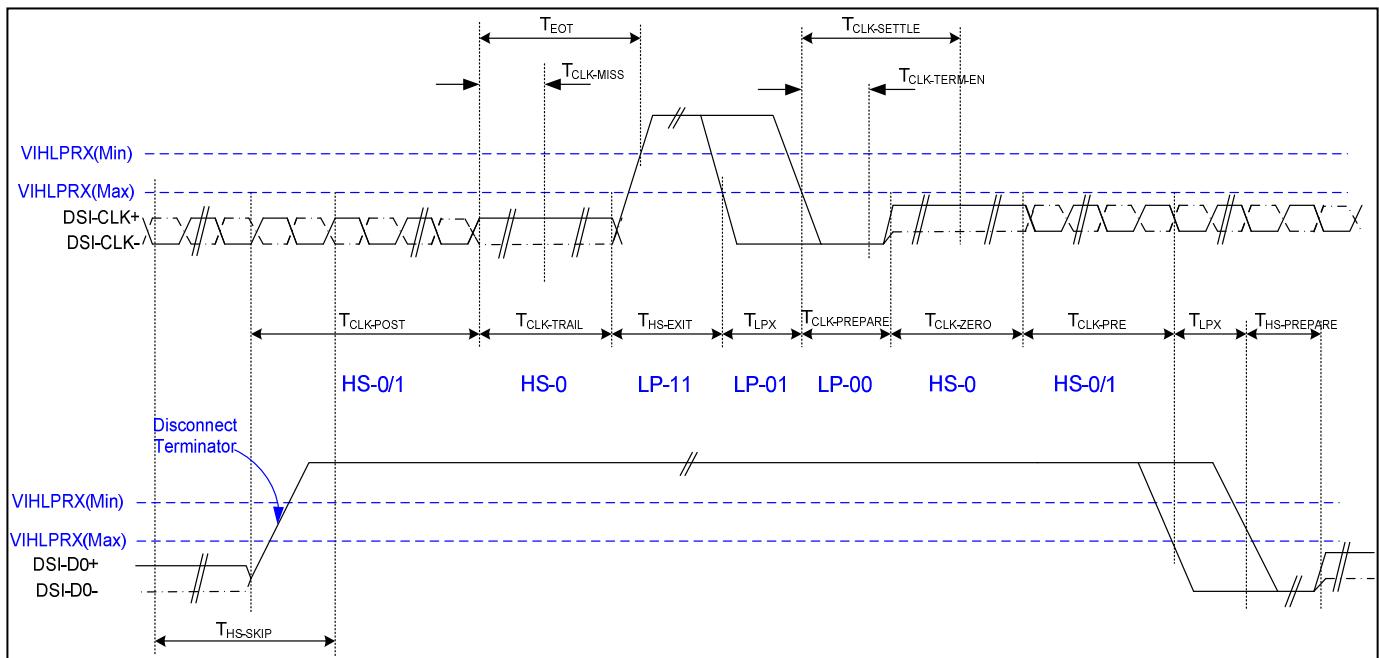

- Timing Characteristics

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
DSI-CLK+/-	$2xUI_{INSTA}$	Double UI instantaneous	4	25	ns	-
DSI-CLK+/-	UI_{INSTA} UI_{INSTB}	UI instantaneous halves	2	12.5	ns	$UI = UI_{INSTA} = UI_{INSTB}$
DSI-Dn+/-	tDS	Data to clock setup time	0.15	-	UI	-
DSI-Dn+/-	tDH	Data to clock hold time	0.15	-	UI	-

- Data Transmission

Data lanes-Low Power Mode to/from High Speed Mode Timing

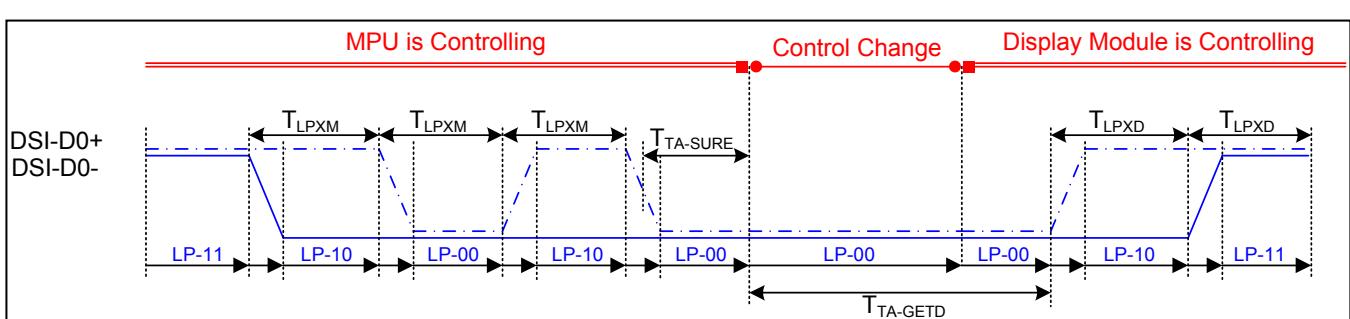

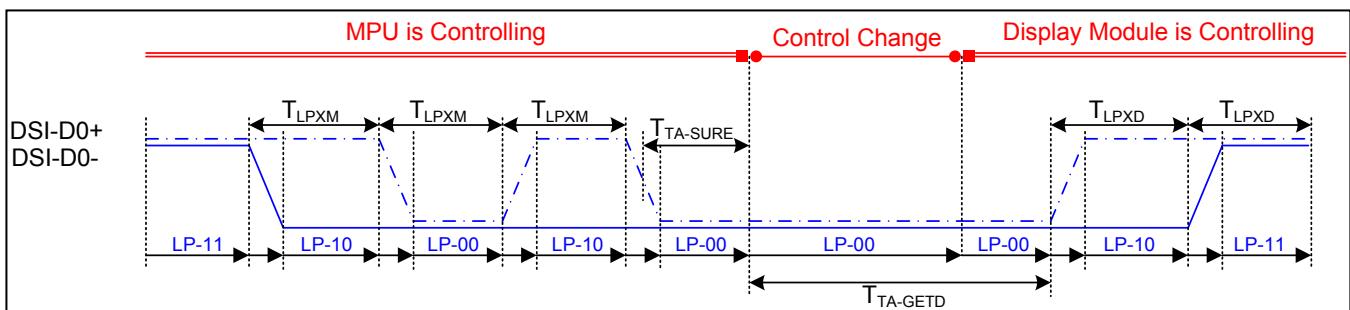

Clock lanes- High Speed Mode to/from Low Power Mode Timing

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
Low Power Mode to High Speed Mode Timing						
DSI-Dn+/-	TLPX	Length of any low power state period	50	-	ns	Input
DSI-Dn+/-	THS-PREPARE	Time to drive LP-00 to prepare for HS transmission	40+4UI	85+6UI	ns	Input
DSI-Dn+/-	THS-TERM-EN	Time to enable data receiver line termination measured from when Dn crosses VILMAX	-	35+4UI	ns	Input
DSI-Dn+/-	THS-PREPARE + THS-ZERO	THS-PREPARE + time to drive HS-0 before the sync sequence	140+10U I	-	ns	Input
High Speed Mode to Low Power Mode Timing						
DSI-Dn+/-	THS-SKIP	Time-out at display module to ignore transition period of EoT	40	55+4UI	ns	Input
DSI-Dn+/-	THS-EXIT	Time to drive LP-11 after HS burst	100	-	ns	Input
DSI-Dn+/-	THS-TRAIL	Time to drive flipped differential state after last payload data bit of a HS transmission burst	60+4UI	-	ns	Input
High Speed Mode to/from Low Power Mode Timing						
DSI-CLK+/-	TCLK-POS	Time that the MPU shall continue sending HS clock after the last associated data lane has transition to LP mode	60+52 UI	-	ns	Input
DSI-CLK+/-	TCLK-TRAIL	Time to drive HS differential state after last payload clock bit of a HS transmission burst	60	-	ns	Input
DSI-CLK+/-	THS-EXIT	Time to drive LP-11 after HS burst	100	-	ns	Input
DSI-CLK+/-	TCLK-PREPARE	Time to drive LP-00 to prepare for HS transmission	38	95	ns	Input
DSI-CLK+/-	TCLK-TERM-EN	Time-out at clock lan display module to enable HS transmission	--	38	ns	Input
DSI-CLK+/-	TCLK-PREPARE + TCLK-ZERO	Minimum lead HS-0 drive period before starting clock	300	-	ns	Input
DSI-CLK+/-	TCLK-PRE	Time that the HS clock shall be driven prior to any associated data lane beginning the transition from LP to HS mode	8UI	-	ns	Input
DSI-CLK+/-	TEOT	Time form start of TCLK-TRAIL period to start of LP-11 state	-	105ns+ 12UI	ns	Input

Mipi Interface- High Speed Mode Timing Characteristics

7.4.2. Bus Turnaround Procedure

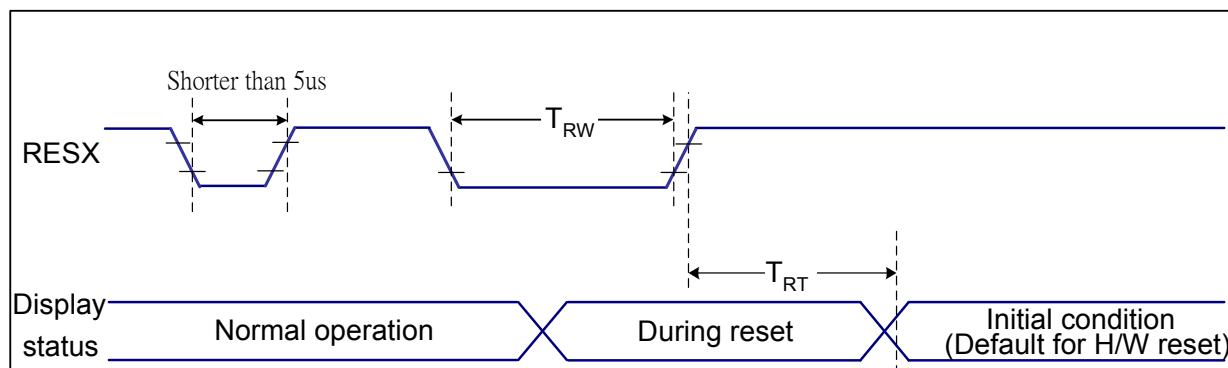

$VDDI=1.8V, VCI=2.8V, AGND=DGND=AGNDR=0V, Ta=25^\circ C$

Signal	Symbol	Parameter	MIN	MAX	Unit	Description
DSI-D0+/-	TLPXM	Length of LP-00,LP-01, LP-10 or LP-11 periods MPU→Display Module	50	75	ns	Input
DSI-D0+/-	TLPXD	Length of LP-00,LP-01, LP-10 or LP-11 periods MPU→Display Module	50	75	ns	Output
DSI-D0+/-	TTA-SURED	Time-out before the MPU start driving	T_{LPXD}	$2 \times T_{LPXD}$	ns	Output
DSI-D0+/-	TTA-GETD	Time to drive LP-00 by display module	$5 \times T_{LPXD}$		ns	Input
DSI-D0+/-	TTA-GOD	Time to drive LP-00 after turnaround request-MPU	$4 \times T_{LPXD}$		ns	Output

MIPI Interface BTA ModeTiming Characteristics

7.5. Rest Timing

$VDDI=1.8V, VCI=2.8V, AGND=DGND=AGNDR=0V, Ta=25^\circ C$

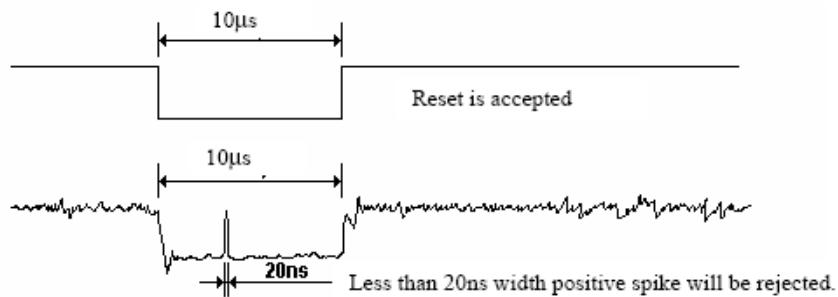

Related Pins	Symbol	Parameter	MIN	MAX	Unit
RESX	TRW	Reset pulse duration	10	-	us
	TRT	Reset cancel	-	5 (Note 1, 5)	ms
			-	120 (Note 1, 6, 7)	ms

Notes:

1. The reset cancel includes also required time for loading ID bytes, VCOM setting and other settings from NVM (or similar device) to registers. This loading is done every time when there is HW reset cancel time (t_{RT}) within 5 ms after a rising edge of RESX.
2. Spike due to an electrostatic discharge on RESX line does not cause irregular system reset according to the table below:

RESX Pulse	Action
Shorter than 5us	Reset Rejected
Longer than 9us	Reset
Between 5us and 9us	Reset starts

3. During the Resetting period, the display will be blanked (The display is entering blanking sequence, which maximum time is 120 ms, when Reset Starts in Sleep Out -mode. The display remains the blank state in Sleep In -mode.) and then return to Default condition for Hardware Reset.
4. Spike Rejection also applies during a valid reset pulse as shown below:

5. When Reset applied during Sleep In Mode.

6. When Reset applied during Sleep Out Mode.

7. It is necessary to wait 5msec after releasing RESX before sending commands. Also Sleep Out command cannot be sent for 120msec.

8. MIPI FUNCTION DESCRIPTION

8.1. MIPI DSI Interface

The Display Serial Interface standard defines protocols between a host processor and peripheral devices that adhere to MIPI Alliance standards for mobile device interfaces. The DSI standard builds on existing standards by adopting pixel formats and command set defined in MIPI Alliance standards.

DSI-compliant peripherals support either of two basic modes of operation: Command Mode and Video Mode. Which mode is used depends on the architecture and capabilities of the peripheral. The mode definitions reflect the primary intended use of DSI for display interconnect, but are not intended to restrict DSI from operating in other applications.

Typically, a peripheral is capable of Command Mode operation or Video Mode operation. Some Video Mode display modules also include a simplified form of Command Mode operation in which the display module may refresh its screen from a reduced-size, or partial, frame buffer, and the interface (DSI) to the host processor may be shut down to reduce power consumption.

Command Mode refers to operation in which transactions primarily take the form of sending commands to a peripheral, such as a display module, that incorporates a display controller. The display controller may include local registers and a frame buffer. Systems using Command Mode write to, and read from, the registers. The host processor indirectly controls activity at the peripheral by sending commands, parameters to the display controller.

The host processor can also read display module status information. Command Mode operation requires a bidirectional interface.

Video Mode refers to operation in which transfers from the host processor to the peripheral take the form of a real-time pixel stream. In normal operation, the display module relies on the host processor to provide image data at sufficient bandwidth to avoid flicker or other visible artifacts in the displayed image. Video information should only be transmitted using High Speed Mode. Some Video Mode architectures may include a simple timing controller and partial frame buffer, used to maintain a partial-screen or lower-resolution image in standby or Low Power Mode. This permits the interface to be shut down to reduce power consumption. To reduce complexity and cost, systems that only operate in Video Mode may use a unidirectional data path.

Configuration:

Lane Pair	MCU (Master)	Display Module (Slave)
Clock Lane	Unidirectional Lane	<ul style="list-style-type: none">■ Clock Only■ Escape Mode(ULPS Only)
Data Lane 0	Bi-directional Lane	<ul style="list-style-type: none">■ Forward High-Speed■ Bi-directional Escape Mode■ Bi-directional LPDT

8.2. Display Serial Interface (DSI)

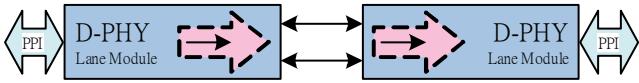

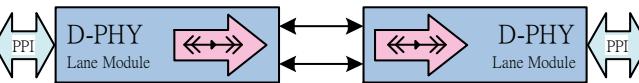

8.2.1. General Description

The communication can be separated 2 different levels between the MCU and the display module:

- Interface Level : Low level communication
- Packet level : High level communication

8.2.2. Interface level communication

The display module uses data and clock lane differential pairs for DSI . Both clock lane and data lane0 can be driven Low Power (LP) or High Speed (HS) mode.

	Lane support mode	
Clock Lane	Unidirectional lane High-Speed Clock only Simplified Escape Mode (ULPS Only)	
Data Lane0	Bi-directional lane Forward high-speed only Bi-directional Escape Mode Bi-direction LPDT	

The interface clock Lane types and support mode

Low Power mode means that each line of the differential pair is used in single end mode and a differential receiver is disable (A termination resistor of the receiver is disable) and it can be driven into a low power mode.

High Speed mode means that differential pairs (The termination resistor of the receiver is enable) are not used in the single end mode.

There are used different modes and protocols in each mode when there are wanted to transfer information from the MCU to the display module and vice versa.

The State Codes of the High Speed (HS) and Low Power (LP) lane pair are defined below.

Lane Pair State Code	Line DC voltage Levels		High Speed(HS)	Low-Power(LP)	
	Dn+ Line	Dn- Line	Burst Mode	Control Mode	Escape Mode
HS-0	Low (HS)	High (HS)	Differential-0	Note 1	Note 1
HS-1	High (HS)	Low (HS)	Differential-1	Note 1	Note 1
LP-00	Low (LP)	Low (LP)	Not Defined	Bridge	Space
LP-01	Low (LP)	High (LP)	Not Defined	HS-Request	Mark-0
LP-10	High (LP)	Low (LP)	Not Defined	LP-Request	Mark-1
LP-11	High (LP)	High (LP)	Not Defined	Stop	Note 2

High Speed and Low-Power Lane Pair State Descriptions

Notes:

1. Low-Power Receivers (LP-Rx) of the lane pair are checking the LP-00 state code, when the Lane Pair is in the High Speed (HS) mode.
2. If Low-Power Receivers (LP-Rx) of the lane pair recognizes LP-11 state code, the lane pair returns to LP-11 of the Control Mode.

8.2.3. DSI-CLK Lanes

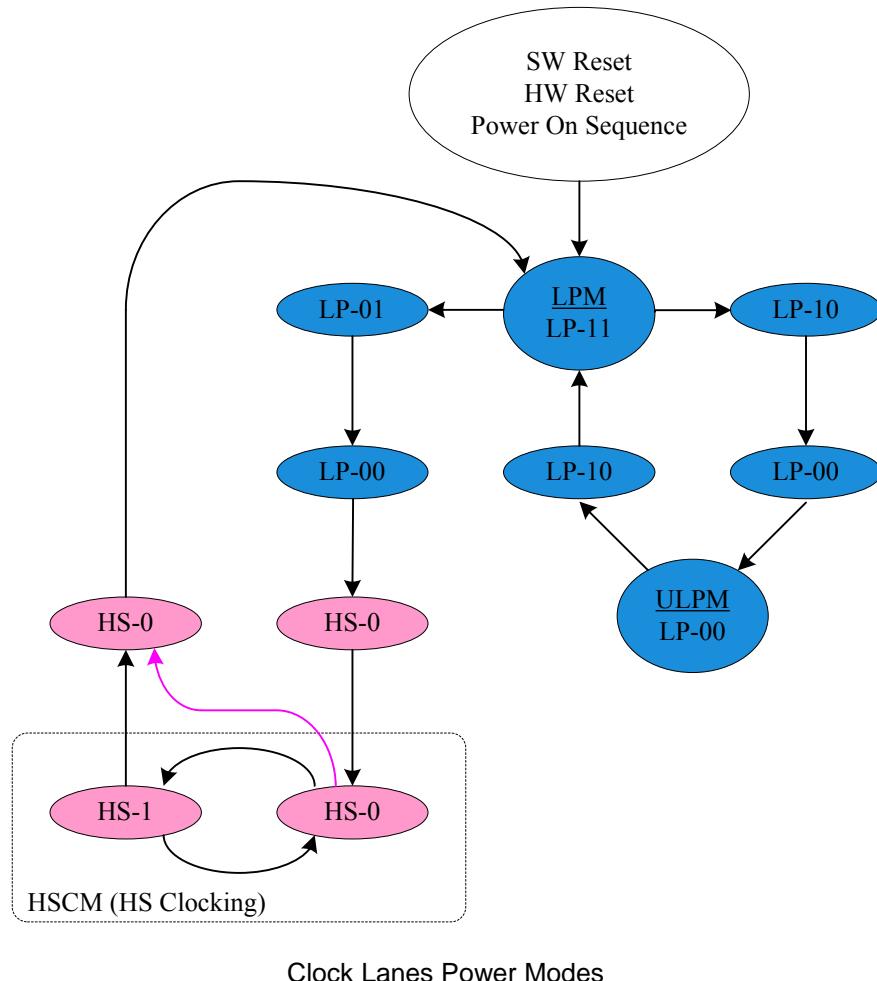

DSI-CLK+/- lanes can be driven into three different power modes: Low Power Mode (LPM LP-11), Ultra Low Power Mode (ULPM) or High Speed Clock Mode (HSCM).

Clock lanes are in a single end mode (LP = Low Power) when there is entering or leaving Low Power Mode(LPM) or Ultra Low Power Mode (ULPM).

Clock lanes are in the single end mode (LP = Low Power) when there is entering in or leaving out High Speed Clock Mode (HSCM).

These entering and leaving protocols are using clock lanes in the single end mode to generate an entering or leaving sequences.

The principal flow chart of the different clock lanes power modes is illustrated below.

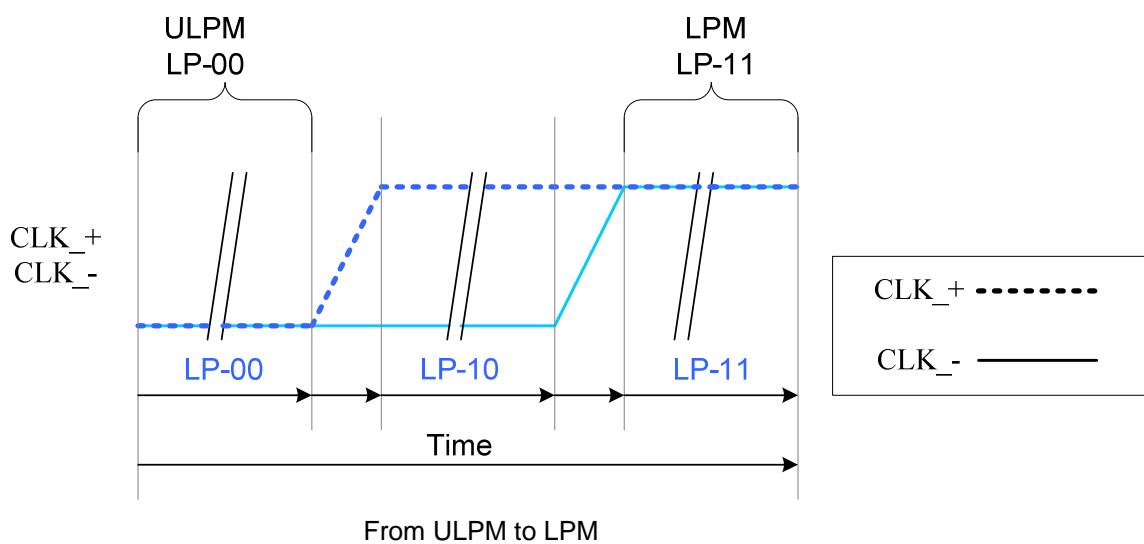

8.2.4. Low Power Mode

DSI-CLK+/- lanes can be driven to the Low Power Mode(LPM),when DSI-CLK lanes are entering LP-11 State Code , in three different ways:

After SW Reset,HW Reset or Power On Sequence=>LP-11

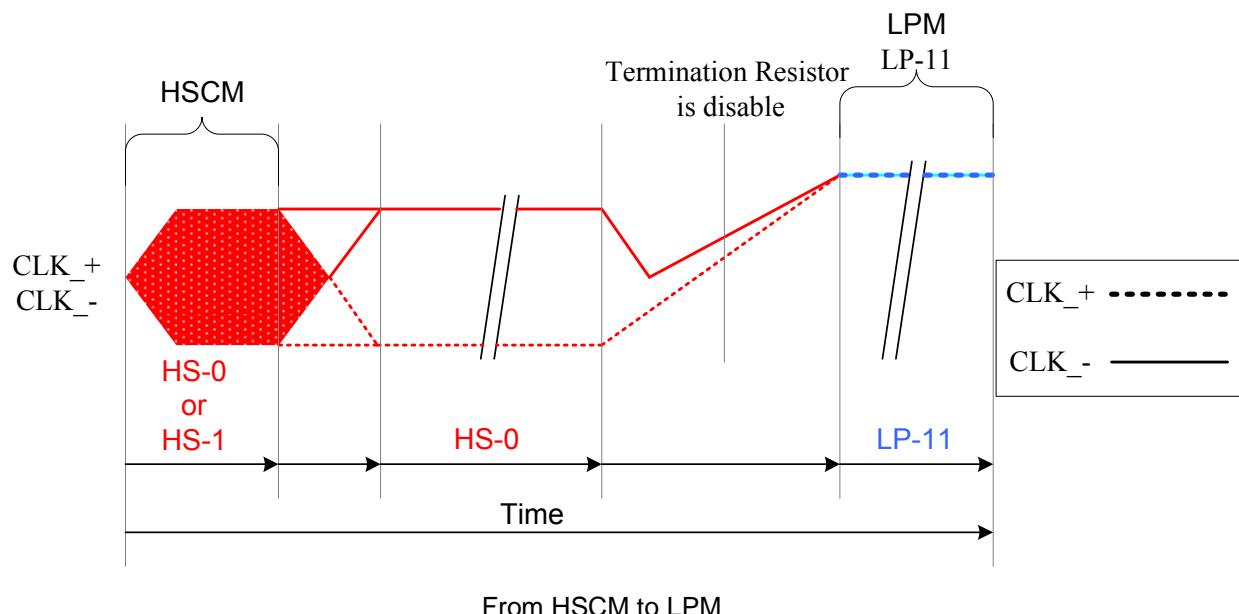

After DSI-CLK+/- lanes are leaving Ultra Low Power Mode (ULPM,LP-00 State Code)=>LP10=>LP-11(LPM).

This sequence is illustrated below.

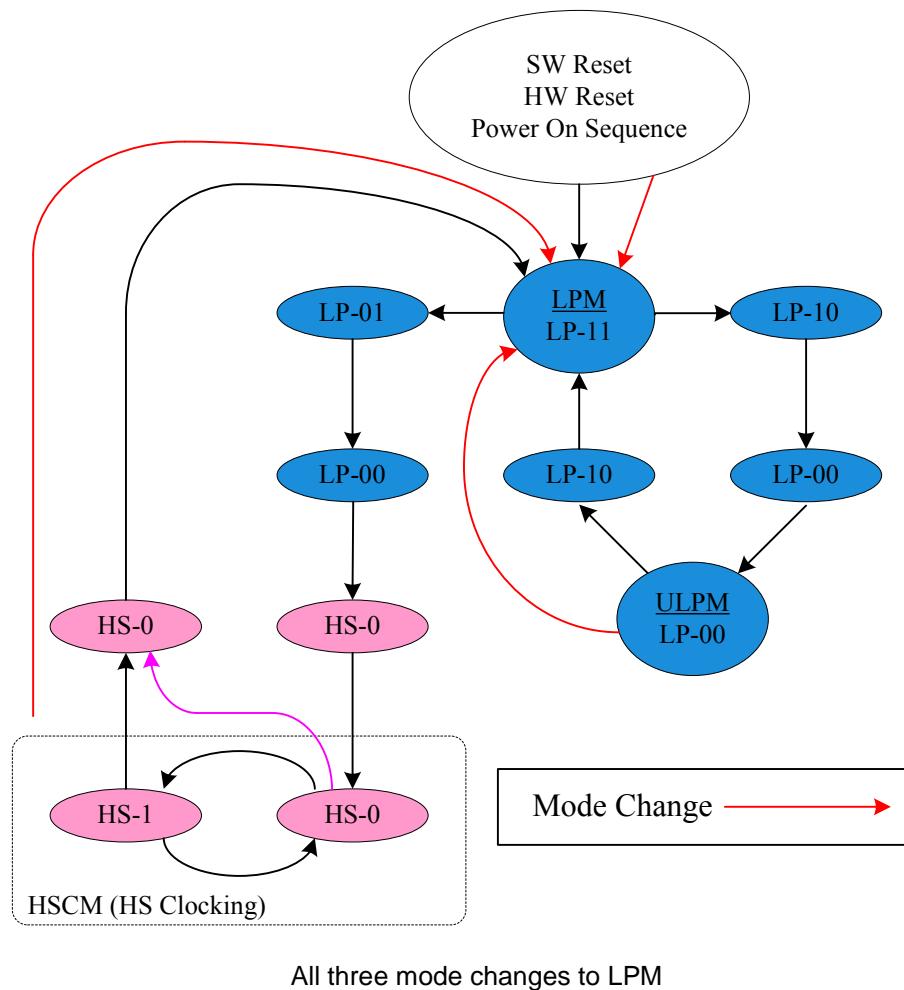

After DSI-CLK+/- lanes are leaving High Speed Clock Mode (HSCM, HS-0 or HS-1 State Code) =>HS-0 =>LP-11 (LPM).

This sequence is illustrated below.

All three mode changes are illustrated a flow chart below.

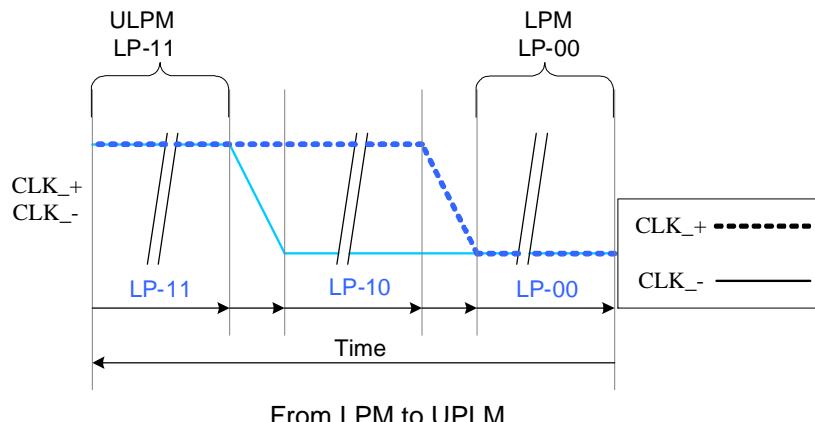

8.2.5. Ultra Low Power Mode

DSI-CLK+/- lanes can be driven to the Ultra Low power Mode (ULPM), when DSI-CLK lanes are entering LP-00

State Code.

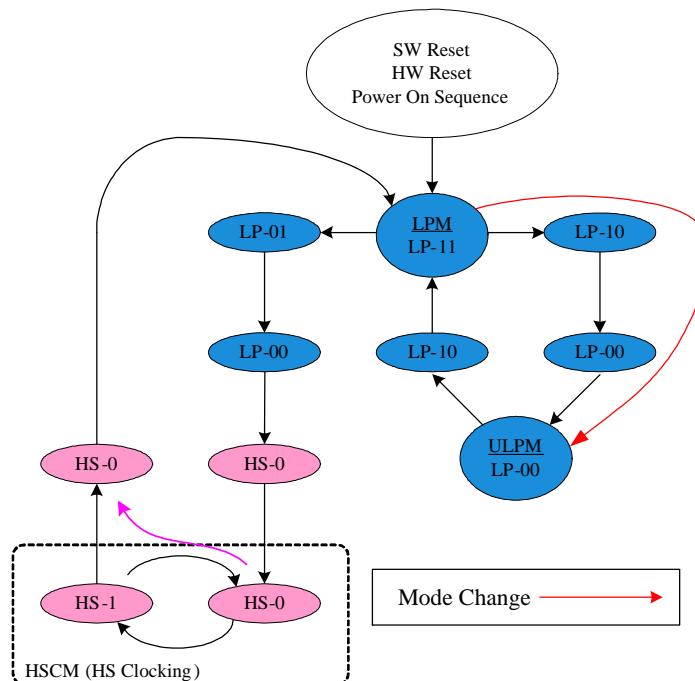

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-10 =>LP-00(ULPM).

This sequence is illustrated below.

From LPM to UPLM

The mode change is also illustrated below:

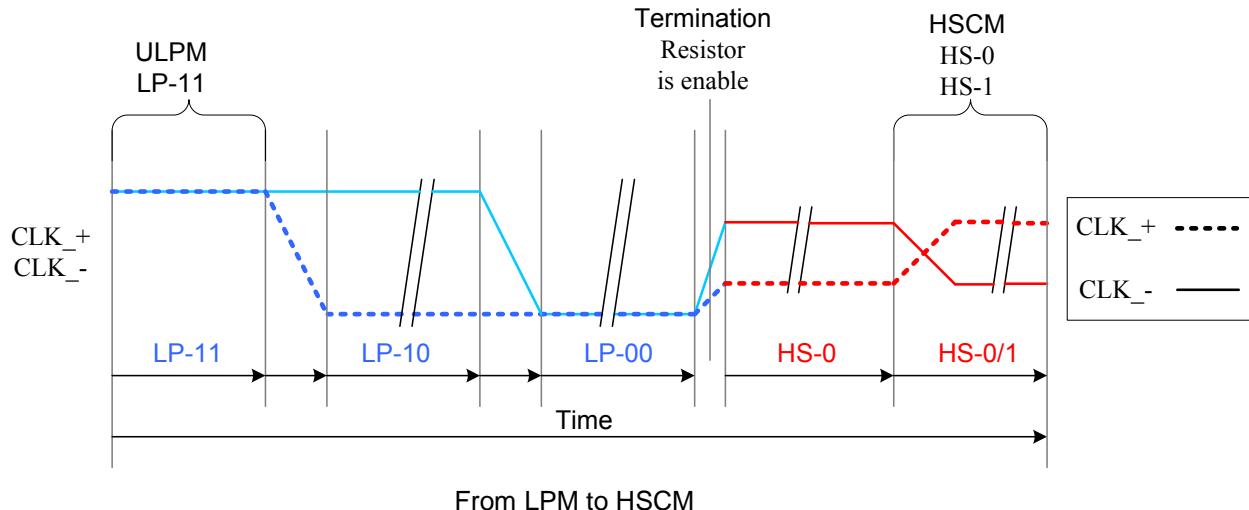

The mode change from LPM to UPLM

8.2.6. High-speed Clock Mode (HSCM)

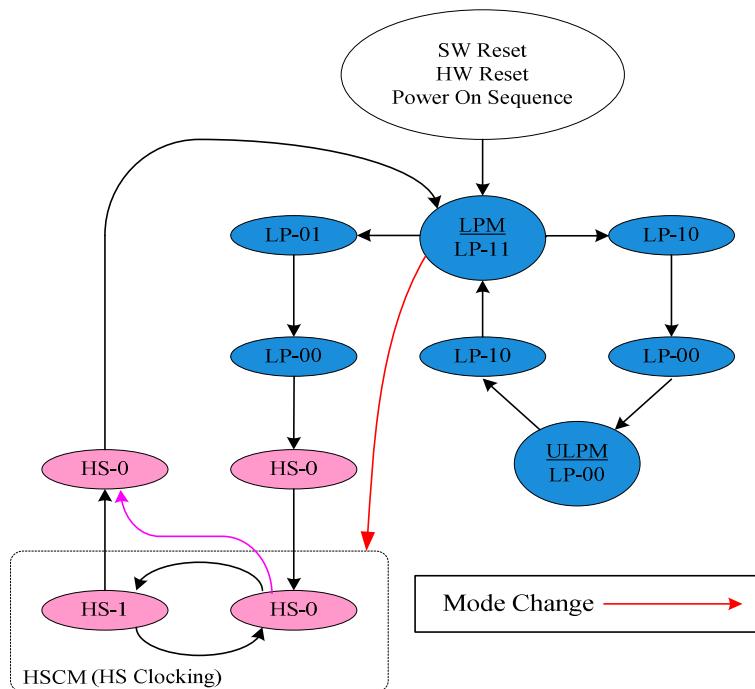

DSI-CLK+/- lanes can be driven to the High Speed Clock Mode (HSCM), when DSI-CLK lanes are starting to work between HS-0 and HS-1 State Codes.

The only entering possibility is from the Low Power Mode (LPM, LP-11 State Code) =>LP-01 =>LP-00 =>HS-0 =>HS-0/1 (HSCM).

This sequence is illustrated below.

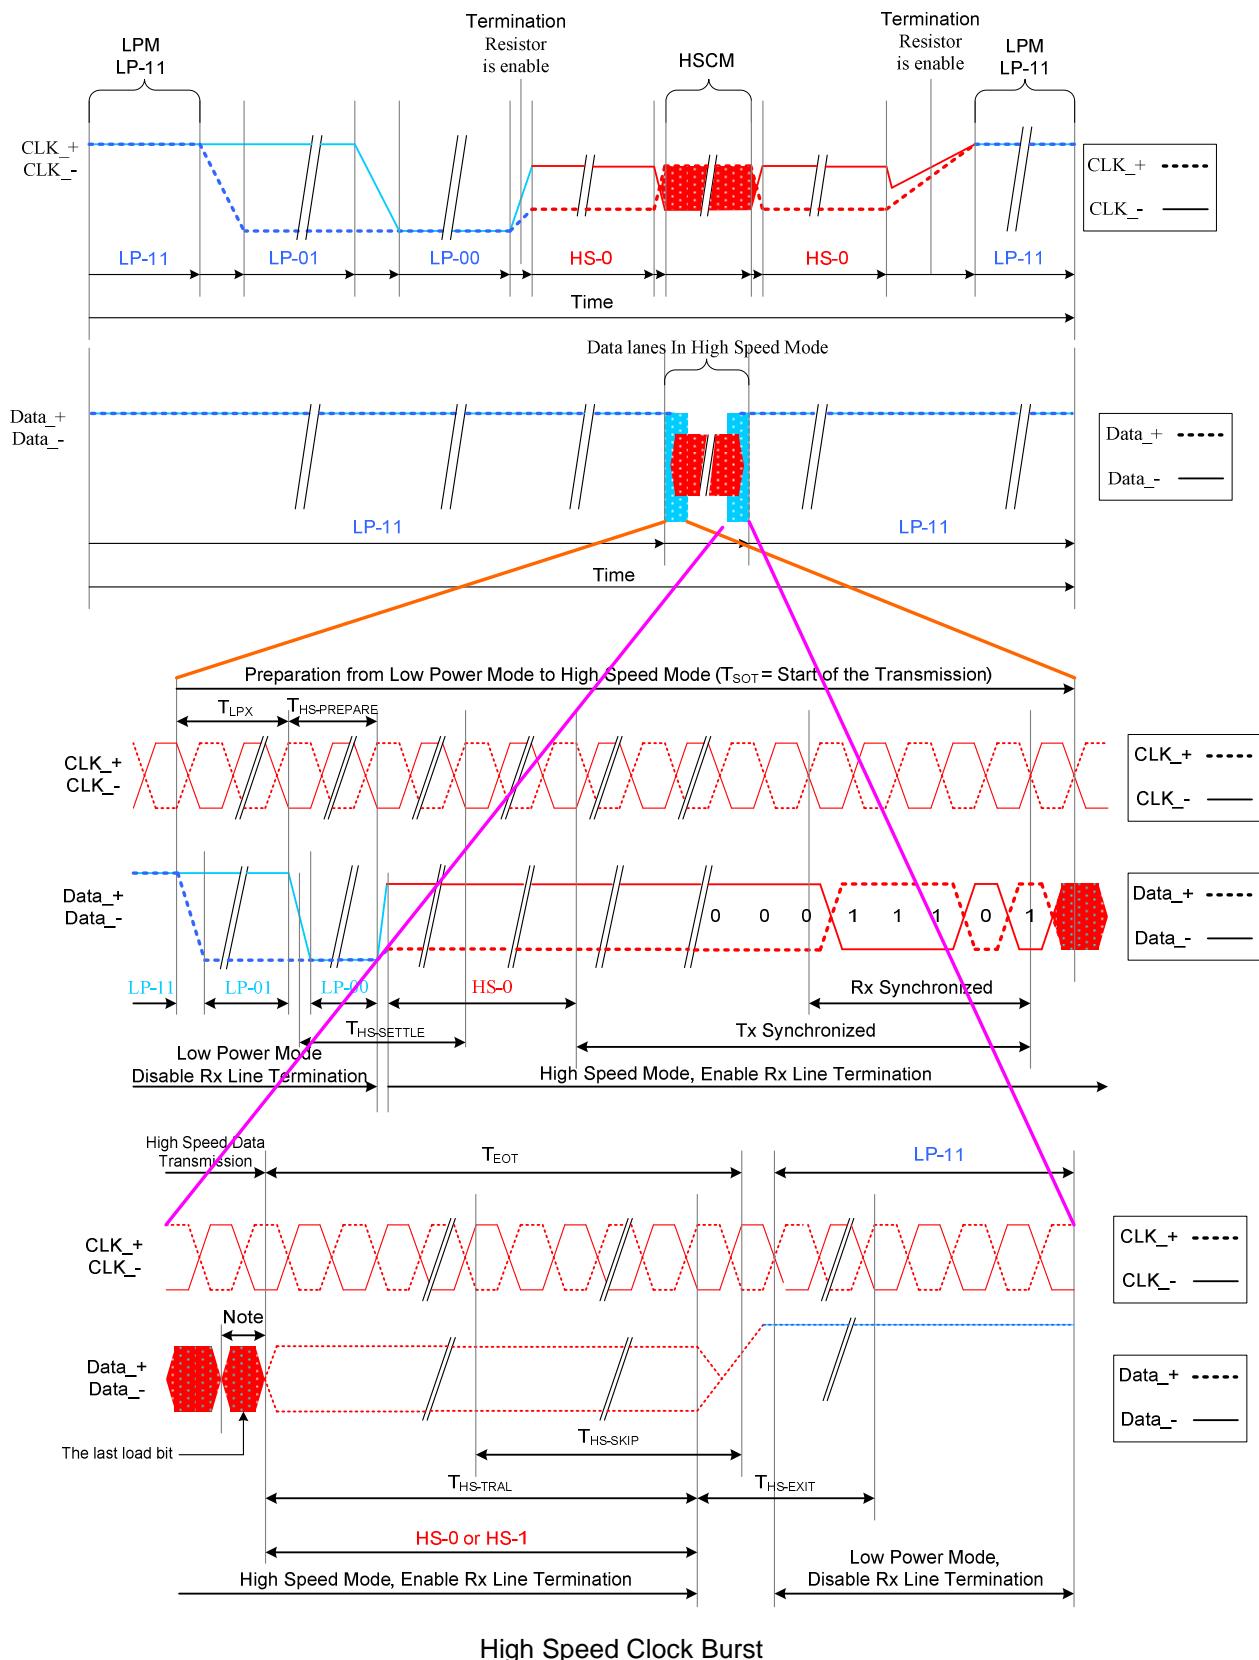

The mode change is also illustrated below:

Mode Change from LPM to HSCM on the Flow Chart

The high speed clock (DSI-CLK+/-) is started before high speed data is sent via DSI-Dn+/ - lanes. The high speed clock continues clocking after the high speed data sending has been stopped.

8.2.7. DSI-DATA LANES

8.2.7.1 GENERAL

DSI-D0+/- Data Lanes can be driven in different modes which are:

- Escape Mode (Only DSI-D0+/- data lanes are used)
- High-Speed Data Transmission (DSI-D1+/- and DSI-D0+/- data lanes are used)
- Bus Turnaround Request (Only DSI-D0+/- data lanes are used)

These modes and their entering codes are defined on the following table.

Mode	Entering Mode Sequence	Leaving Mode Sequence
Escape Mode	LP-11=>LP-10=>LP-00=>LP-01=>LP-00	LP-00=>LP-10=>LP11(Mark1)
High-Speed Data Transmission	LP-11=>LP-01=>LP-00=>HS-0	(HS-0 or HS-1) =>LP-11
Bus Turnaround Request	LP-11=>LP-10=>LP-00=>LP-10=>LP-00	High-Z

Notes:

1. Only DSI-D0+/- data lanes are used.
2. More information on section "Bus Turnaround (BTA)"

8.2.7.2 ESCAPE MODE

Data lanes (DSI-D0+/-) can be used in different Escape Modes when data lanes are in Low Power (LP) mode.

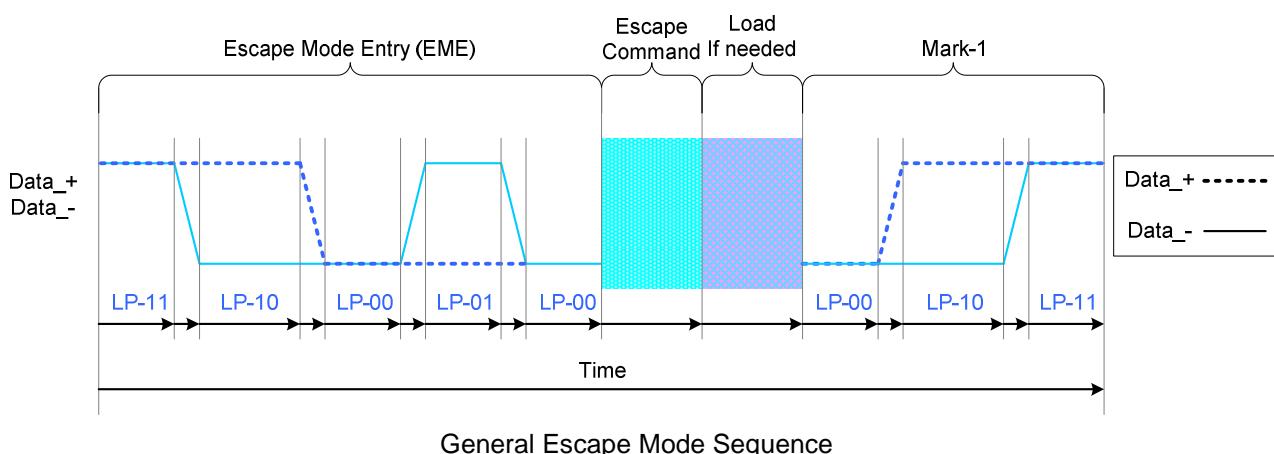

These Escape Modes are used to:

- Send "Low-Power Data Transmission" (LPDT) e.g. from the MCU to the display module
- Drive data lanes to "Ultra-Low Power State" (ULPS)
- Indicate "Remote Application Reset" (RAR), which is reset the display module
- Indicate "Tearing Effect" (TEE), which is used for a TE trigger event from the display module to the MCU
- Indicate "Acknowledge" (ACK), which is used for a non-error event from the display module to the MCU

The basic sequence of the Escape Mode is as follow

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Escape Command (EC), which is coded, when one of the data lanes is changing from low-to-high-to-low then this changed data lane is presenting a value of the current data bit (DSI-D0+ = 1, DSI-D0- = 0) e.g. when DSI-D0- is changing from low-to-high-to-low, the receiver is latching a data bit, which value is logical 0. The receiver is using this low-to-high-to-low transition for its internal clock.
- A load if it is needed
- Exit Escape (Mark-1) LP-00 =>LP-10 =>LP-11
- End: LP-11

This basic construction is illustrated below:

The number of the different Escape Commands (EC) is eight. These eight different escape commands (EC) can be divided 2 different groups: Mode or Trigger. The MCU is informing to the display module that it is controlling data lanes (DSI-D0+/-) with the mode e.g. The MCU can inform to the display module that it can put data lanes in the low power mode. The MCU is waiting from the display module event information, which has been set by the MCU, with the trigger e.g. when the display module reaches a new V-synch, the display module sent to the MCU a TE trigger (TEE), if the MCU has been requested it. Escape commands are defined on the next table.

This basic construction is illustrated below:

Escape command	Command Type Mode / Trigger	Entry command Pattern (First Last Bit Transmitted)
Low-Power Data	Mode	1110 0001 b
Ultra-Low Power Mode	Mode	0001 1110 b
Undefined-1, Note	Mode	1001 1111 b
Undefined-2, Note	Mode	1101 1110 b
Remote Application Reset	Trigger	0110 0010 b
Tearing Effect	Trigger	0101 1101 b
Acknowledge	Trigger	0010 0001 b
Unknown-5, Note	Trigger	1010 0000 b

Note: This Escape command support has not been implemented on the display module.

- Low-Power Data Transmission(LPDT)

The MCU can send data to the display module in Low-Power Data Transmission (LPDT) mode when data lanes are entering in Escape Mode and Low-Power Data Transmission (LPDT) command has been sent to the display module. The display module is also using the same sequence when it is sending data to the MCU.

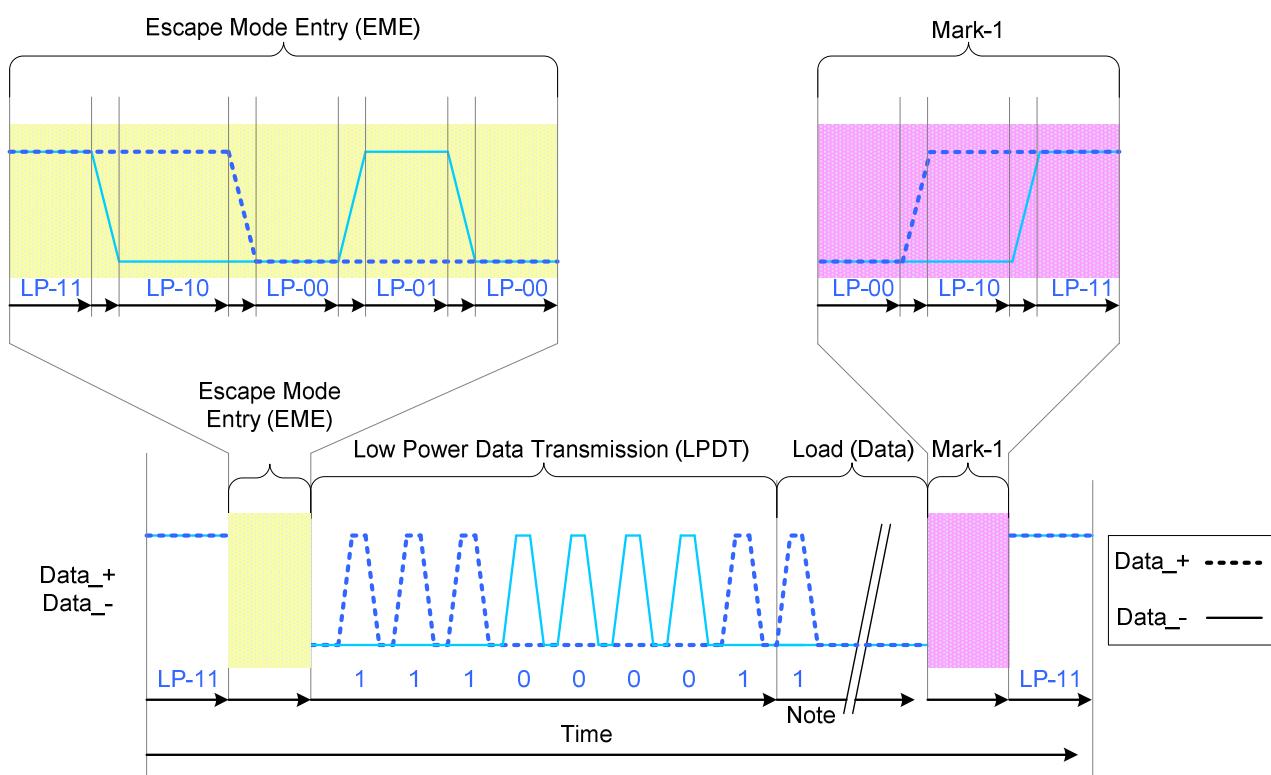

The Low Power Data Transmission (LPDT) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Low-Power Data Transmission (LPDT) command in Escape Mode: 1110 0001 (First to Last bit)
- Load (Data): One or more bytes (8 bits)

Data lanes are in pause mode when data lanes are stopped (Bothe lanes are low) between bytes

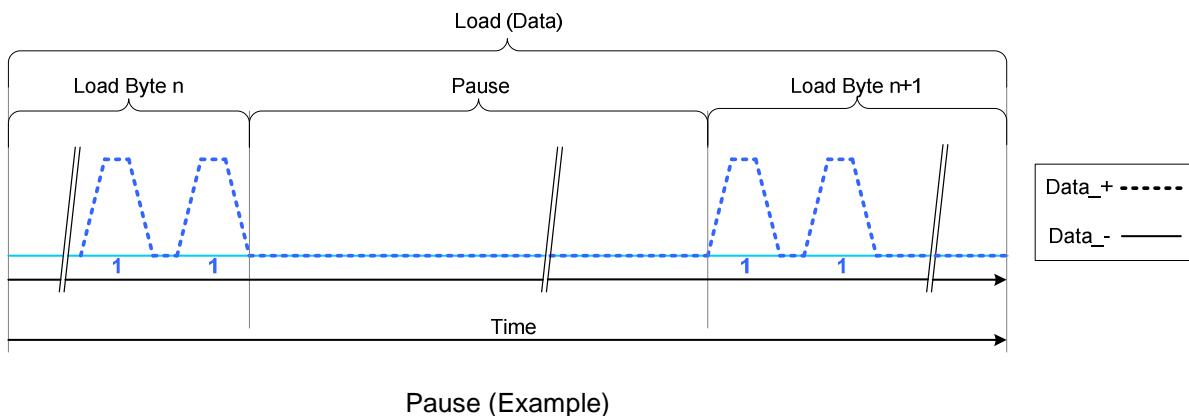

- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

Note : Load (Data) is presenting that the first bit is logical “1” in this Example

Low-Power Data Transmission (LPDT)

Pause (Example)

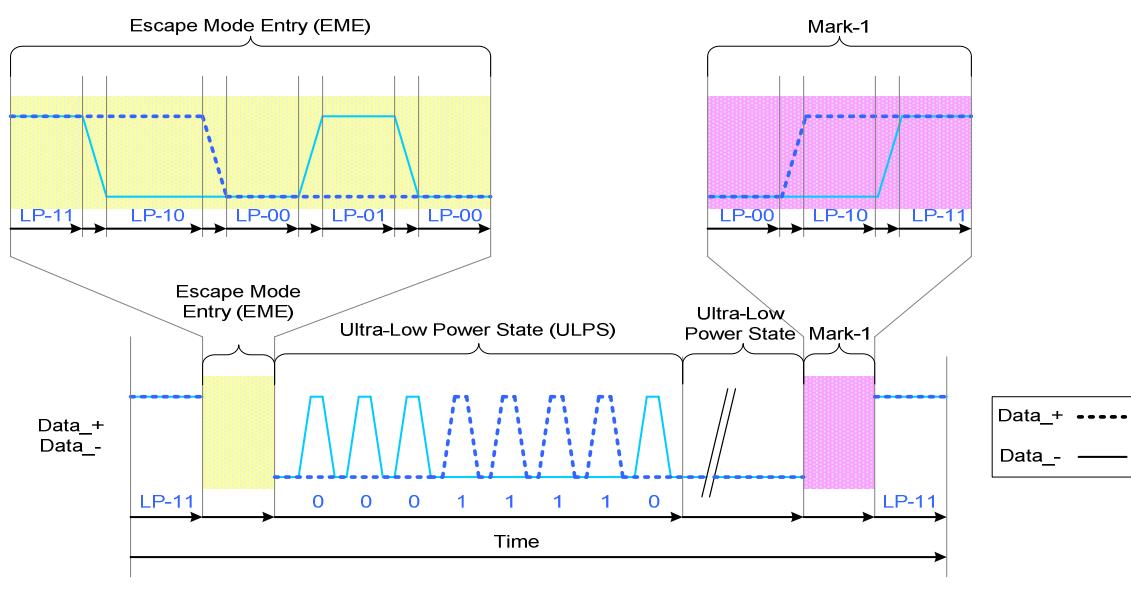

● Ultra-Low Power State(ULPS)

The MCU can force data lanes in Ultra-Low Power State (ULPS) mode when data lanes are entering in Escape Mode.

The Ultra-Low Power State (ULPS) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Ultra-Low Power State (ULPS) command in Escape Mode: 0001 1110 (First to Last bit)
- Ultra-Low Power State (ULPS) when the MCU is keeping data lanes low
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

Ultra-Low Power State (ULPS)

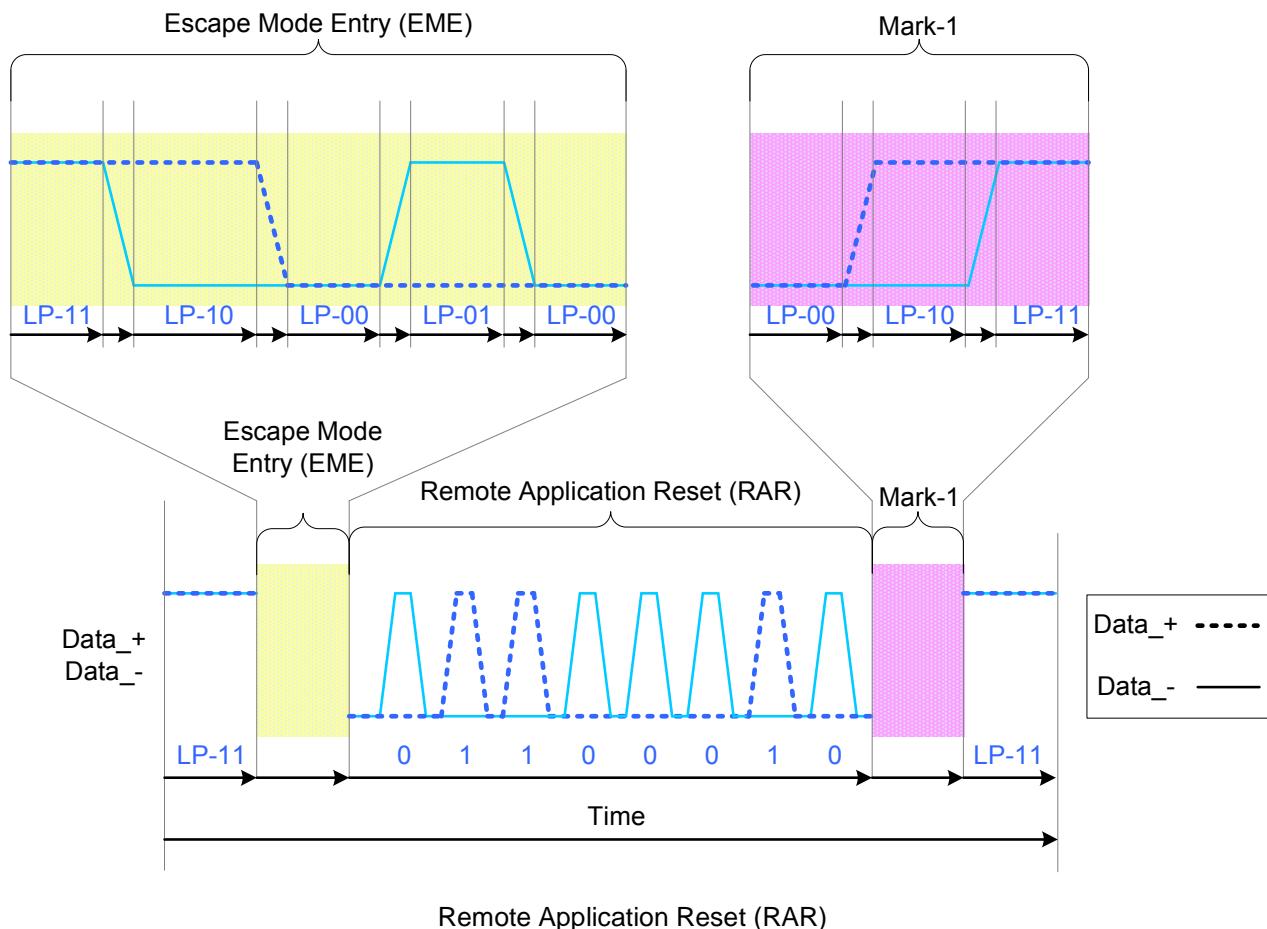

- Remote Application Reset(RAP)

The MCU can inform to the display module that it should be reset in Remote Application Reset (RAR) trigger when data lanes are entering in Escape Mode.

The Remote Application Reset (RAR) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Remote Application Reset (RAR) command in Escape Mode: 0110 0010 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

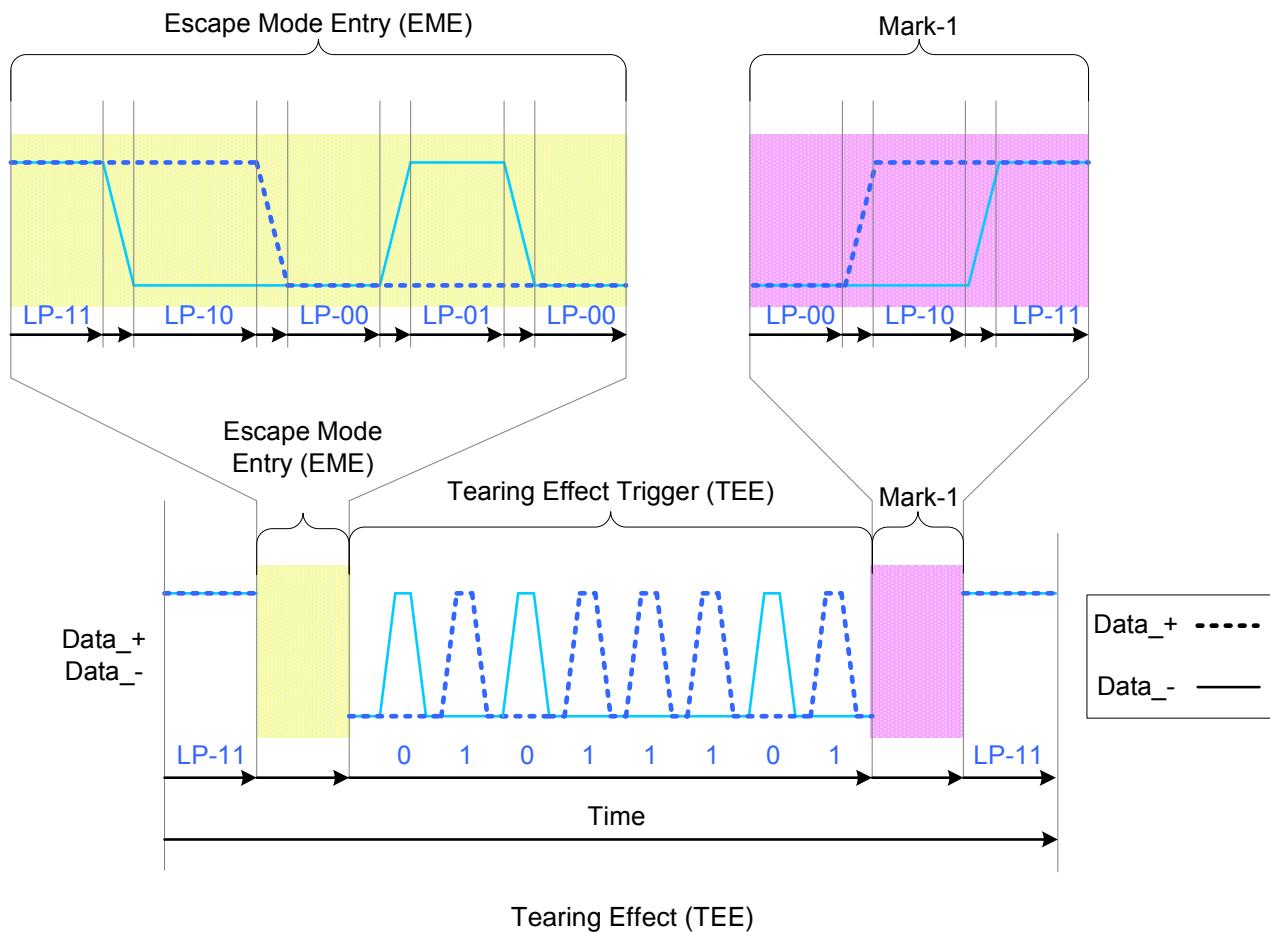

- Tearing Effect (TEE)

The display module can inform to the MCU when a tearing effect event (New V-synch) has been happen on the display module by Tearing Effect (TEE).

The Tearing Effect (TEE) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Tearing Effect (TEE) trigger in Escape Mode: 0101 1101 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

Note: Tearing Effect (TEE) can not be used in MIPI Video Mode

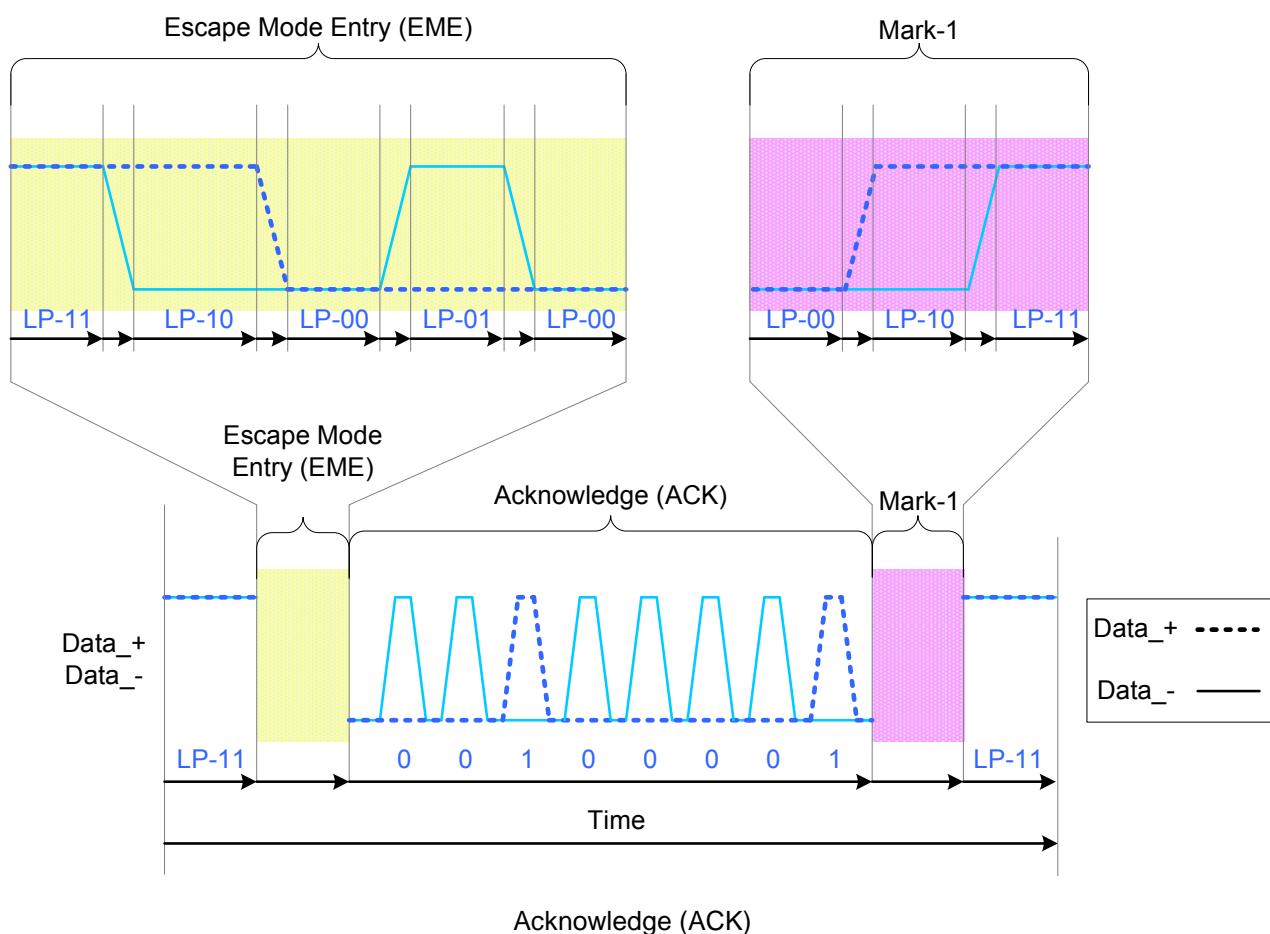

- Acknowledge(ACK)

The display module can inform to the MCU when an error has not recognized on it by Acknowledge (ACK).

The Acknowledge (ACK) is using a following sequence:

- Start: LP-11
- Escape Mode Entry (EME): LP-11 =>LP-10 =>LP-00 =>LP-01 =>LP-00
- Acknowledge (ACK) command in Escape Mode: 0010 0001 (First to Last bit)
- Mark-1: LP-00 =>LP-10 =>LP-11
- End: LP-11

This sequence is illustrated for reference purposes below:

8.2.8. High Speed Data Transmission(HSDP)

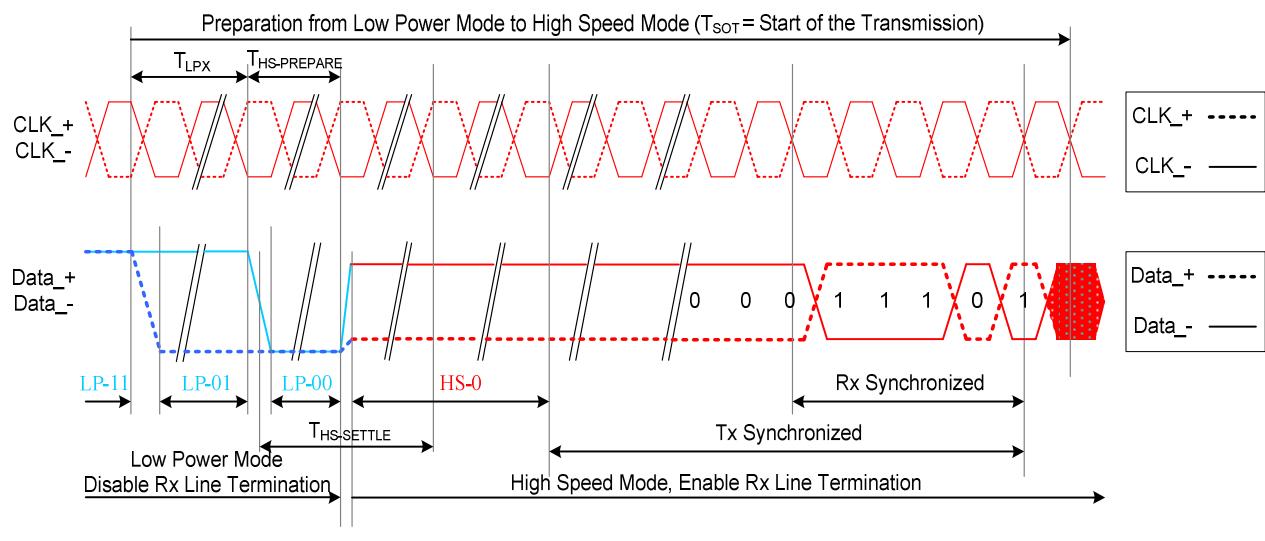

- Entering High-Speed Data Transmission (Tsot of HSDT)

The display module is entering High-Speed Data Transmission (HSDT) when Clock lanes DSI-CLK+/- have already been entered in the High-Speed Clock Mode (HSCM) by the MCU.

Data lanes of the display module are entering (TSOT) in the High-Speed Data Transmission (HSDT) as follows

- Start: LP-11
- HS-Request: LP-01
- HS-Settle: LP-00 => HS-0 (Rx: Lane Termination Enable)
- Rx Synchronization: 011101 (Tx (= MCU) Synchronization: 0001 1101)
- End: High-Speed Data Transmission (HSDT) – Ready to receive High-Speed Data Load

This same entering High-Speed Data Transmission (TSOT of HSDT) sequence is illustrated below

Entering High-Speed Data transmission (Tsot of HSDT)

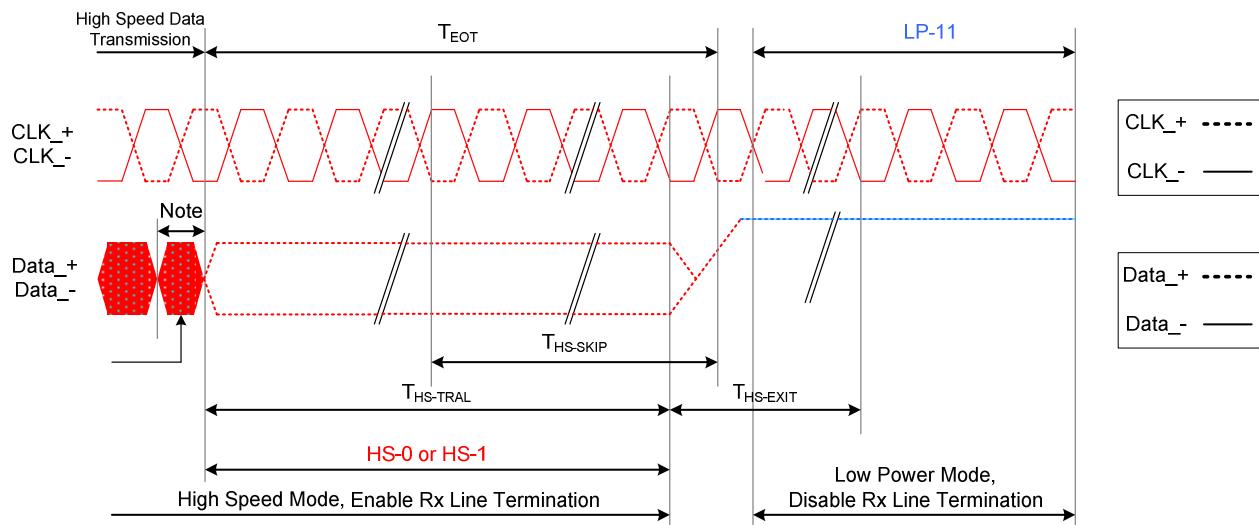

- Leaving High-Speed Data Transmission (TEOT of HSDT)

The display module is leaving the High-Speed Data Transmission (TEOT of HSDT) when Clock lanes DSI-CLK+/- are in the High-Speed Clock Mode (HSCM) by the MCU and this HSCM is kept until data lanes are in LP-11 mode.

Data lanes of the display module are leaving from the High-Speed Data Transmission (TEOT of HSDT) as follows

- Start: High-Speed Data Transmission (HSDT)
- Stops High-Speed Data Transmission
- MCU changes to HS-1, if the last load bit is HS-0
- MCU changes to HS-0, if the last load bit is HS-1
- End: LP-11 (Rx: Lane Termination Disable)

This same leaving High-Speed Data Transmission (TEOT of HSDT) sequence is illustrated below

Leaving High-Speed data Transmission (T_{EOT} of HSDT)

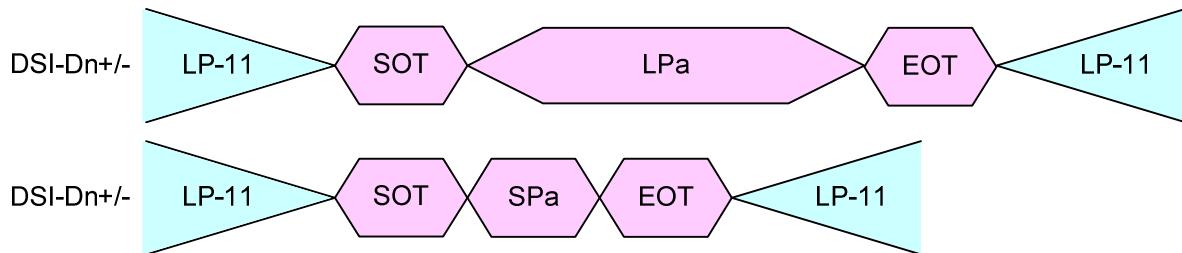

● Burst of the High-Speed Data Transmission(HSDT)

The burst of the high-speed data transmission (HSDT) can consist of one data packet or several data packets.

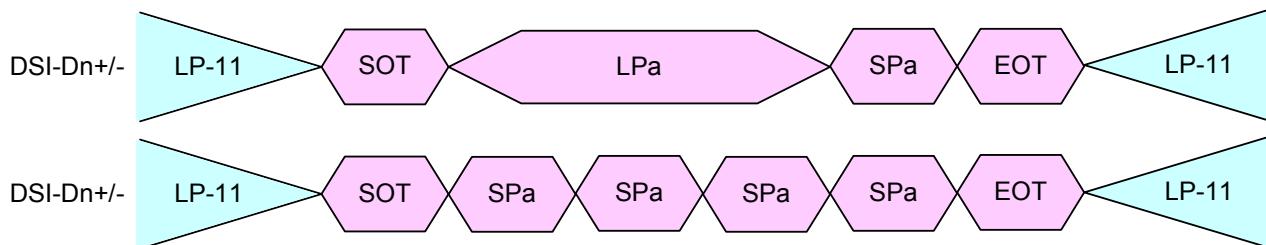

These data packets can be Long (LPa) or Short (SPa) packets.

These different burst of the High-Speed Data Transmission (HSDT) cases are illustrated for reference purposes below.

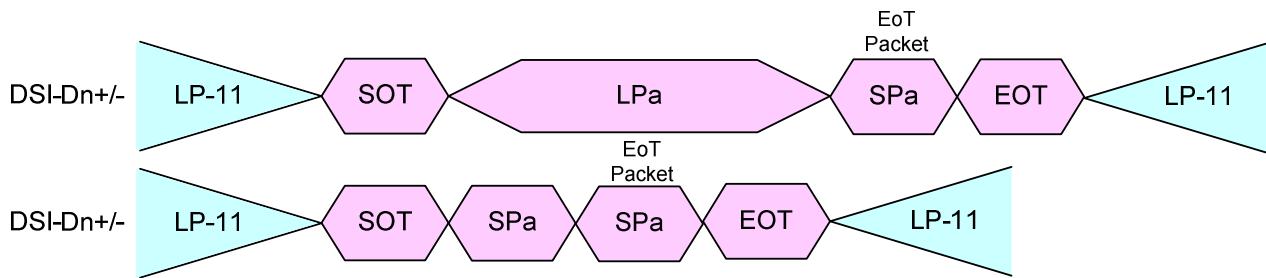

Single Packet in High Speed Data Transmission

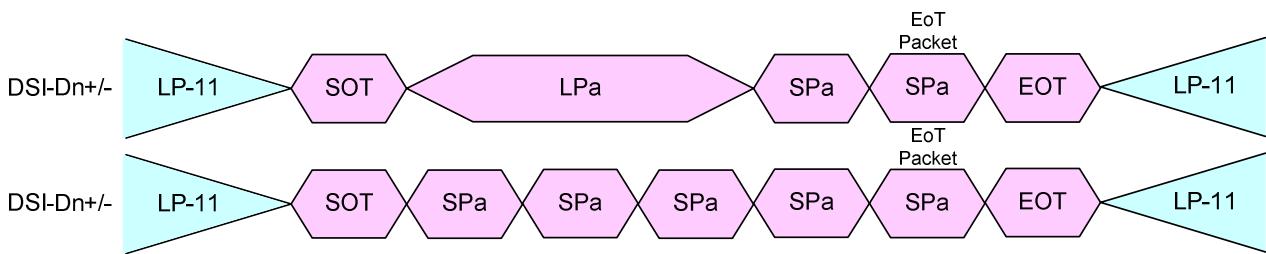

Multiple Packets in High Speed Data Transmission

Single Packet in High Speed Data Transmission

Multiple Packets in High Speed Data Transmission

Abbreviation	Explanation
EOT	End of the Transmission
LPa	Long Packet
LP-11	Low Power Mode, Data lanes are '1's (Stop Mode)
SPA	Short Packet
SOT	Start of the Transmission

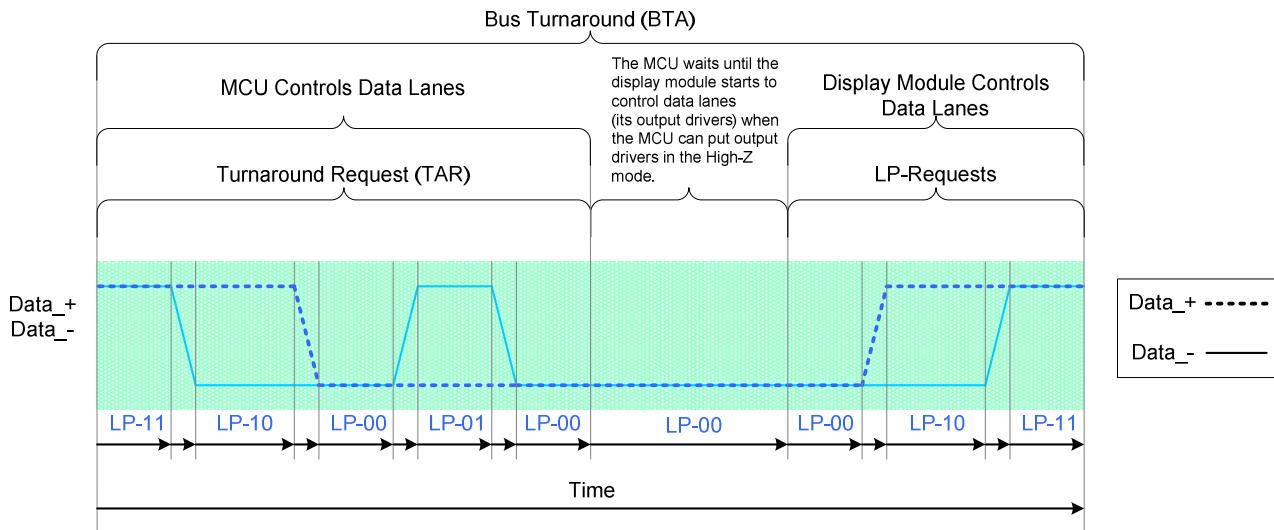

- Bus Turnaround(BTA)

The MCU or display module, which is controlling DSI-D0+/- Data Lanes, can start a bus turnaround procedure when it wants information from a receiver, which can be the MCU or display module.

The MCU or display module are using the same sequence when this bus turnaround procedure is used. This sequence is described for reference purposes, when the MCU wants to do the bus turnaround procedure to the display module, as follow.

- Start (MCU):LP-11
- Turnaround Request (MCU): LP-11 _ LP-10 _ LP-00 _ LP-10 _ LP-00
- The MCU wait until the display module is starting to control DSI-D0+/- data lanes and the MCU stop to control DSI-D0+/- data lanes (=High-Z)
- The display module changes to the stop mode: LP-00 _ LP-10 _ LP-11

The same bus turnaround procedure (From the MCU to the display module) is illustrated below.

Bus Turnaround Procedure

MCU and the display module terms are switched on above figure, if the Bus Turnaround (BTA) is from the display module to the MCU..

8.2.9. Packet Level Communication

8.2.9.1 Short Packet (SPA) And Long Packet (LPA) Structure

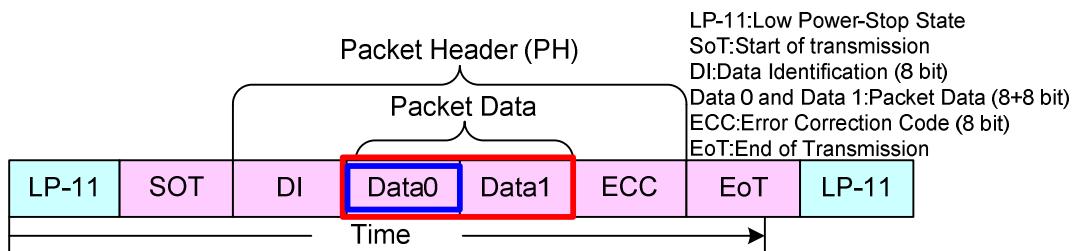

Short Packet (SPA) and Long Packet (LPA) are always used when data transmission is done in Low Power Data Transmission (LPDT) or High-Speed Data Transmission (HSDT) modes.

The lengths of the packets are

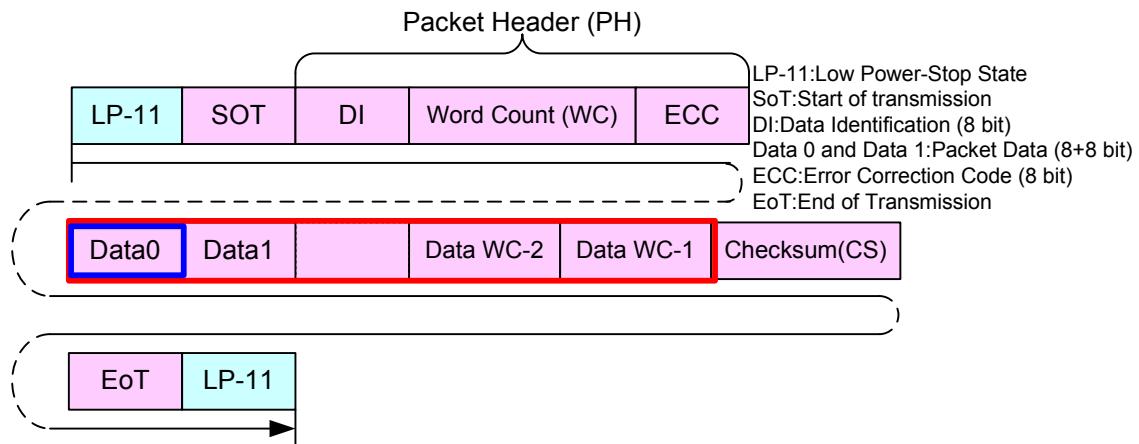

- Short Packet (SPA): 4 bytes
- Long Packet (LPA): From 6 to 65,541 bytes

The type (SPA or LPA) of the packet can be recognized from their package headers (PH).

Short Packet (SPA) Structure:

Long Packet (Spa) Structure:

Note:

Short Packet (Spa) Structure and Long Packet (Lpa) Structure are presenting a single packet sending (= Includes LP-11, SoT and EoT for each packet sendings).

The other possibility is that there is not needed SoT, EoT and LP-11 between packets if packets have sent in multiple packet format e.g.

* LP-11 =>SoT =>Spa =>Lpa =>Spa =>Spa =>EoT =>LP-11

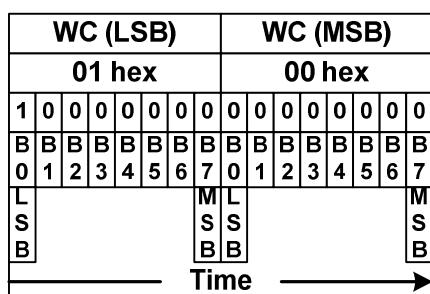

* LP-11 =>SoT =>Spa =>Spa =>Spa =>EoT =>LP-11

* LP-11 =>SoT =>Lpa =>Lpa =>Lpa =>EoT =>LP-11

8.2.9.2 Bit Order of the Multiple Byte Information on Packets

Byte order of the multiple bytes information, what is used on packets, is that the Least Significant (LS) Byte of the information is sent in the first and the Most Significant (MS) Byte of the information is sent in the last e.g. Word Count (WC) consists of 2 bytes (16 bits) when the LS byte is sent in the first and the MS byte is sent in the last.

This same order is illustrated for reference purposes below.

Byte Order of the Multiple Byte on Packets

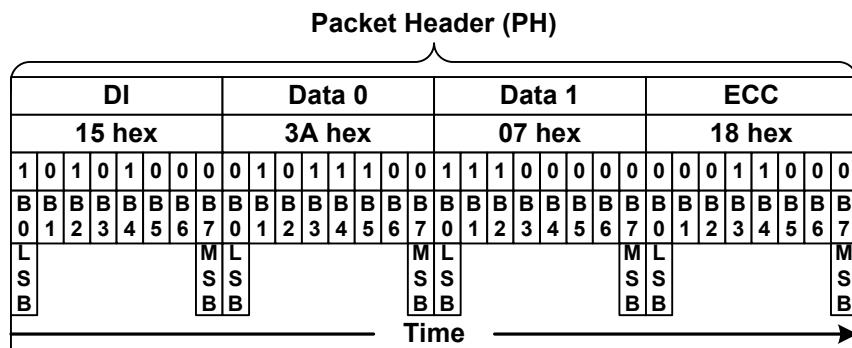

8.2.9.3 Pack Header (PH)

The packet header is always consisting of 4 bytes. The content of these 4 bytes are different if it is used to Short

Packet (SPa) or Long Packet (LPa).

Short Packet (SPa):

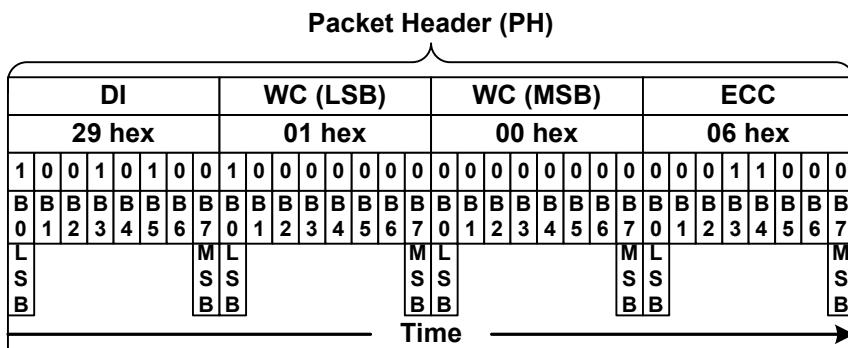

- 1st byte: Data Identification (DI) => Identification that this is Short Packet (SPa)
 - 2nd and 3rd bytes: Packet Data (PD), Data 0 and 1
 - 4th byte: Error Correction Code (ECC)

Packet Header (PH) on Short Packet(Spa)

Long Packet (LPa):

- 1st byte: Data Identification (DI) => Identification that this is Long Packet (LPA)
 - 2nd and 3rd bytes: Word Count (WC)
 - 4th byte: Error Correction Code (ECC)

Packet Header (PH) on Long Packet (LPa)

● Data Identification(DI)

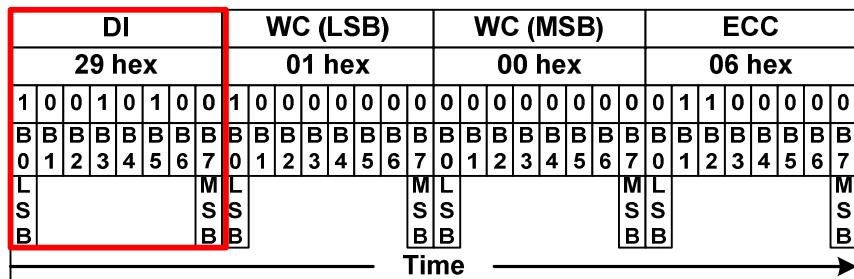

Data Identification (DI) is a part of Packet Header (PH) and it consists of 2 parts:

- Virtual Channel (VC), 2 bits, DI[7...6]
 - Data Type (DT), 6 bits, DI[5...0]

The Data Identification (DI) structure is illustrated on a table below.

Data Identification (DI)							
Virtual Channel (VC)		Data Type (DT)					
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Data Identification (DI) Structure

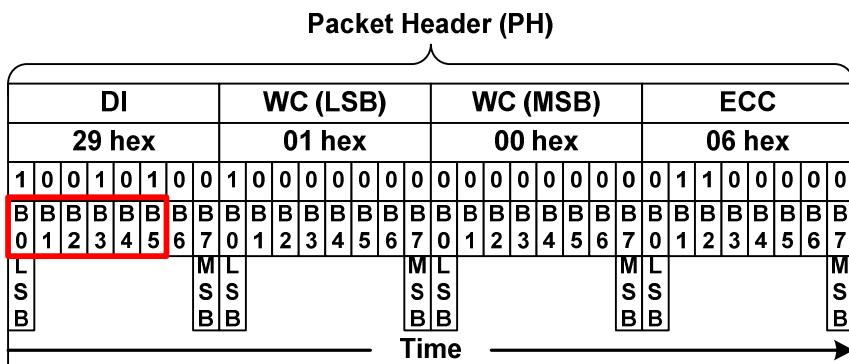

Data Identification (DI) on the Packet Header(PH)

● Data Type(DT)

Data Type (DT) is a part of Data Identification (DI[5...0]) structure and it is used to define a type of the used data on a packet.

Bits of the Data Type (DT) are illustrated for reference purposes below.

Data Type (DT) on the Packet Header (PH)

This Data Type (DT) also defines what the used packet is: Short Packet (SPa) or Long Packet (LPa). Data Types (DT) are different from the MCU to the display module (or other devices) and vice versa.

These Data Type (DT) are defined on tables below.

Data Type Hex	Data Type Binary	Description	Packet Size
01h	00 0001	Sync Event, V Sync Start.	Short
11h	01 0001	Sync Event, V Sync End.	Short
21h	10 0001	Sync Event, H Sync Start.	Short
31h	11 0001	Sync Event, H Sync End.	Short
08h	00 1000	End of Transmission (EoT) packet.	Short
02h	00 0010	Color Mode (CM) Off Command.	Short
12h	01 0010	Color Mode (CM) On Command.	Short
22h	10 0010	Shut Down Peripheral Command.	Short
32h	11 0010	Turn On Peripheral Command.	Short
03h	00 0011	Generic Short WRITE, no parameters	Short
13h	01 0011	Generic Short WRITE, 1 parameter.	Short
23h	10 0011	Generic Short WRITE, 2 parameters.	Short
04h	00 0100	Generic READ, no parameters.	Short
14h	01 0100	Generic READ, 1 parameter.	Short
24h	10 0100	Generic READ, 2 parameters.	Short
05h	00 0101	DCS WRITE, no parameter.	Short
15h	01 0101	DCS WRITE, 1 parameter.	Short
06h	00 0110	DCS READ, no parameter.	Short
37h	11 0111	Set Maximum Return Packet Size.	Short
09h	00 1001	Null Packet, no data.	Long
19h	01 1001	Blanking Packet, no data.	Long
29h	10 1001	Generic Long Write.	Long
39h	11 1001	DCS Long Write/write_LUT Command Packet.	Long
0Eh	00 1110	Packed Pixel Stream, 16-bit RGB,5-6-5 Format.	Long
1Eh	01 1110	Packed Pixel Stream, 18-bit RGB,6-6-6 Format.	Long
2Eh	10 1110	Loosely Packed Pixel Stream,18-bit RGB,6-6-6 Format	Long
3Eh	11 1110	Packed Pixel Stream,24-bit RGB,8-8-8 Format.	Long

Data Type (DT) from MCU to the Display Module (or Other Devices)

From the Display Module (or Other Devices) to the MCU									
Hex	B5	B4	B3	B2	B1	B0	Description	Packet	Abbreviation
02h	0	0	0	0	1	0	Acknowledge with Error Report	Short	AwER
1Ch	0	1	1	1	0	0	DCS Read Long Response	Short	DCSRR_L
21h	1	0	0	0	0	1	DCS Read Short Response, 1 byte returned	Short	DCSRR1_S
22h	1	0	0	0	1	0	DCS Read Short Response, 2 byte returned	Short	DCSRR2_S
1Ah	0	1	1	0	1	0	Generic Read Long Response	Short	GENRR-L
11h	0	1	0	0	0	1	Generic Read Short Response, 1 byte returned	Short	GENRR1-S
12h	0	1	0	0	1	0	Generic Read Short Response, 2 byte returned	Short	GENRR2-S

Data Type (DT) from the Display Module (or Other Devices) to the MCU

The receiver will ignore other Data Type (DT) if they are not defined on tables: "Data Type (DT) from the MCU to the Display Module (or Other Devices)" or " Data Type (DT) from the Display Module (or Other Devices) to the MCU".

- Packet Data (PD) on the Short Packet (SPa)

Packet Data (PD) of the Short Packet (SPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Short Packet (SPa) is wanted to send.

The Word Count (WC) indicates the number of Bytes of Packet of Packet Data (PD) send after the Packet Header.

Packet Data (PD) of the Short Packet (SPa) consists of 2 data bytes: Data 0 and Data 1.

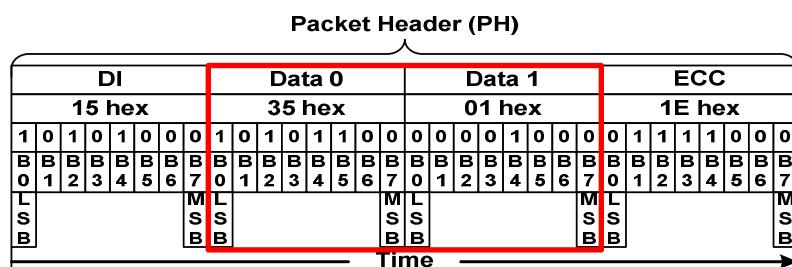

Packet Data (PD) sending order is that Data 0 is sent in the first and the Data 1 is sent in the last.

Bits of Data 1 are set to '0' if the information length is 1 byte.

Packet Data (PD) of the Short Packet (SPa), when the length of the information is 1 or 2 bytes are illustrated for reference purposes below, when Virtual Channel (VC) is 0.

Packet Data (PD) information:

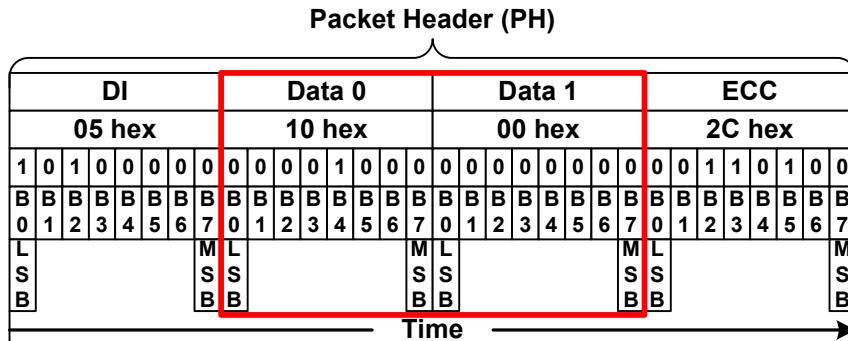

- Data 0: 35hex (Display Command Set (DCS) with 1 Parameter => DI(Data Type (DT)) = 15hex)
- Data 1: 01hex (DCS's parameter)

Packet Data (PD) for Short Packet (SPa), 2 Bytes Information

Packet Data (PD) information:

- Data 0: 10hex (DCS without parameter => DI(Data Type (DT)) = 05hex)
 - Data 1: 00hex (Null)

Packet Data(PD) fo Short Packet (Spa), 1 Bytes Information

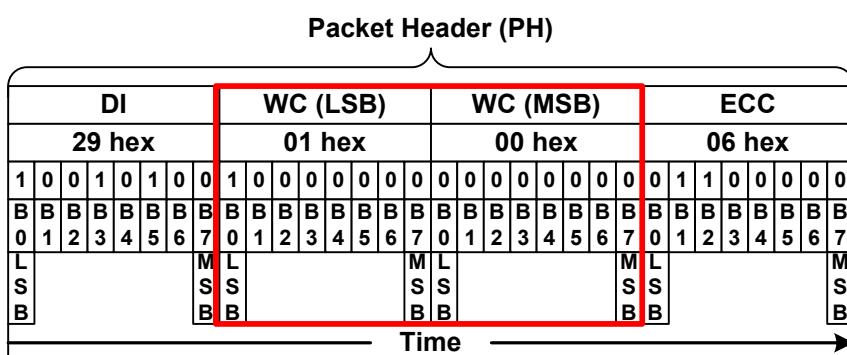

- Word Count(WC) on the Long Packet(LPa)

Word Count (WC) of the Long Packet (LPa) is defined after Data Type (DT) of the Data Identification (DI) has indicated that Long Packet (LPa) is wanted to send.

Word Count (WC) indicates a number of the data bytes of the Packet Data (PD) what is wanted to send after Packet Header (PH) versus Packet Data (PD) of the Short Packet (SPa) is placed in the Packet Header (PH). Word Count (WC) of the Long Packet (LPa) consists of 2 bytes.

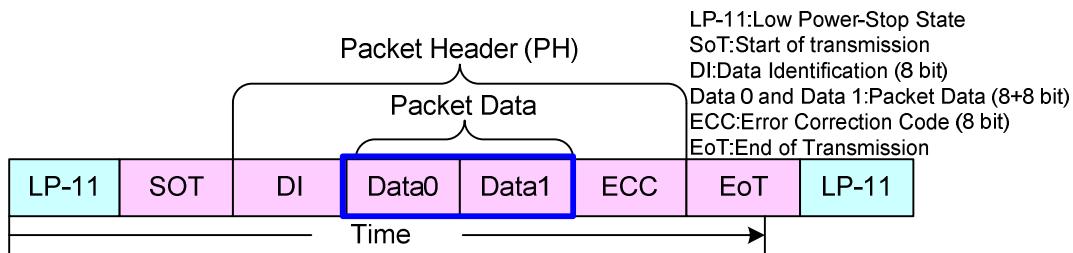

These 2 bytes of the Word Count (WC) sending order is that the Least Significant (LS) Byte is sent in the first and the Most Significant (MS) Byte is sent in the last.

Word Count (WC) of the Long Packet (LPa) is illustrated for reference purposes below.

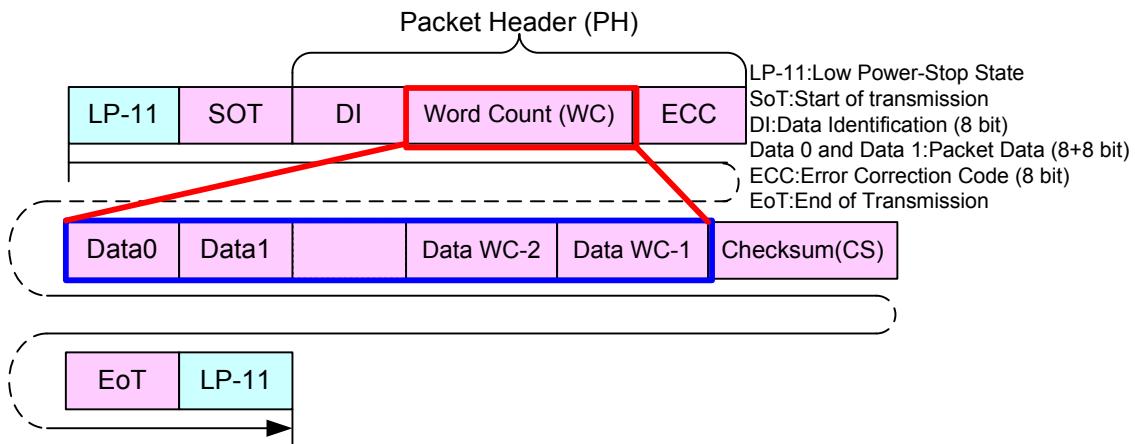

Word Count (WC) on the Long Packet (LPa)

Short Packet:

Long Packet:

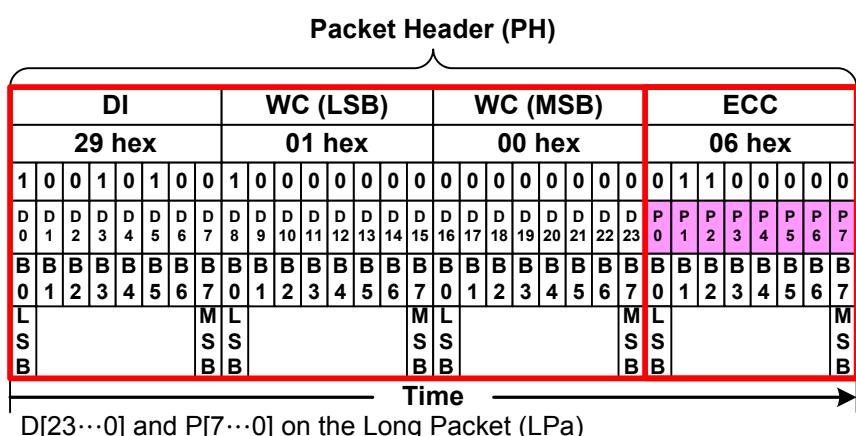

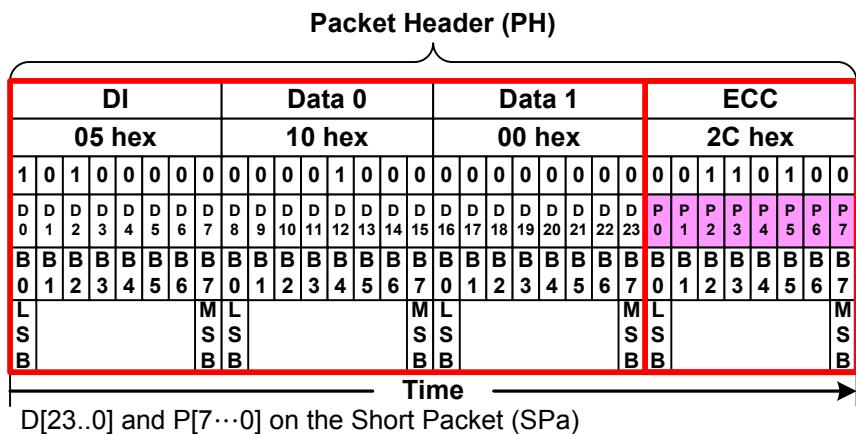

● Error Correction Code (ECC)

Error Correction Code (ECC) is a part of Packet Header (PH) and its purpose is to identify an error or errors on the Packet Header (PH):

The ECC protects the following field"

- Short Packet (SPa): Data Identification (DI) byte (8 bits, D[0...7]), Packet Data (PD) bytes (16 bits, D[8...23]) and ECC(8 bits: P[0...7])
- Long Packet (LPa): Data Identification (DI) byte (8 bits, D[0...7]), Word Count (WC) bytes (16 bits: D[8..23]) and ECC (8 bits, P[0...7])

D[23...0] and P[7...0] are illustrated for reference purposes below.

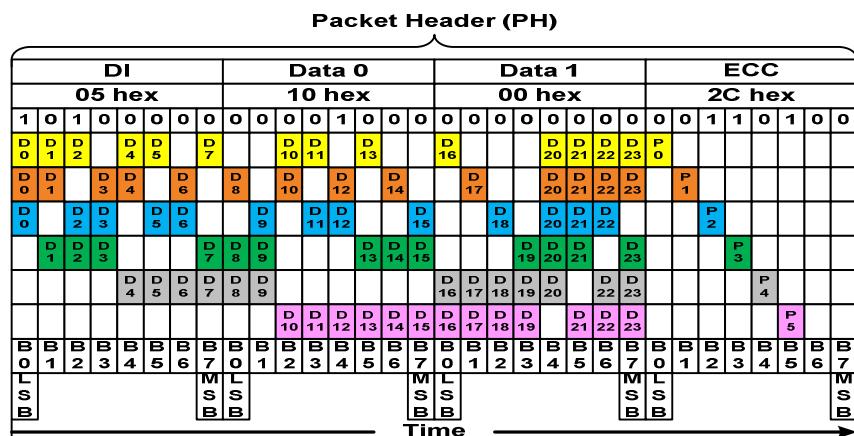

Error Correction Code (ECC) can recognize one error or several errors and makes correction in one bit error case.

Bits ($P[7 \dots 0]$) of the Error Correction Code (ECC) are defined, where the symbol '^' is presenting XOR function

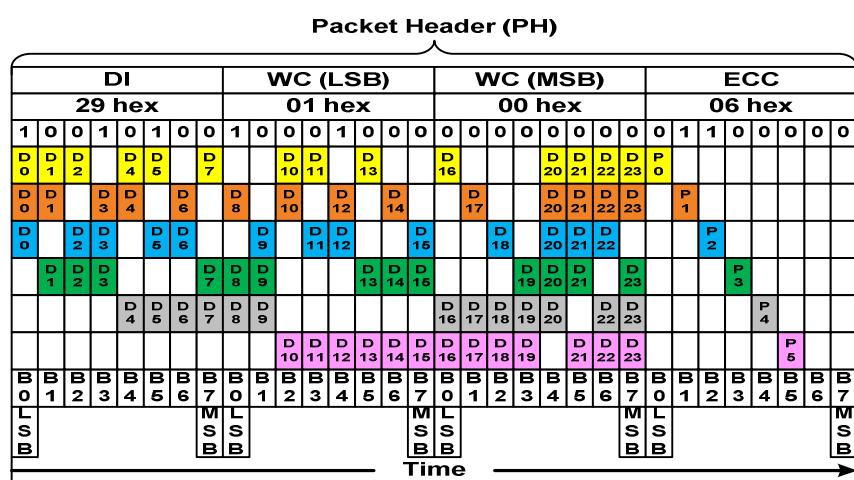

(P_n is '1' if there is odd number of '1's and P_n is '0' if there is even number of '1's), as follows.

- P7 = 0
 - P6 = 0
 - P5 = D10^D11^D12^D13^D14^D15^D16^D17^D18^D19^D21^D22^D23
 - P4 = D4^D5^D6^D7^D8^D9^D16^D17^D18^D19^D20^D22^D23
 - P3 = D1^D2^D3^D7^D8^D9^D13^D14^D15^D19^D20^D21^D23
 - P2 = D0^D2^D3^D5^D6^D9^D11^D12^D15^D18^D20^D21^D22
 - P1 = D0^D1^D3^D4^D6^D8^D10^D12^D14^D17^D20^D21^D22^D23
 - P0 = D0^D1^D2^D4^D5^D7^D10^D11^D13^D16^D20^D21^D22^D23

P7 and P6 are set to '0' because Error Correction Code (ECC) is based on 64 bit value ([D63...0]), but this implementation is based on 24 bit value (D[23...0]). Therefore, there is only needed 6 bits (P[5...0]) for Error Correction Code (ECC).

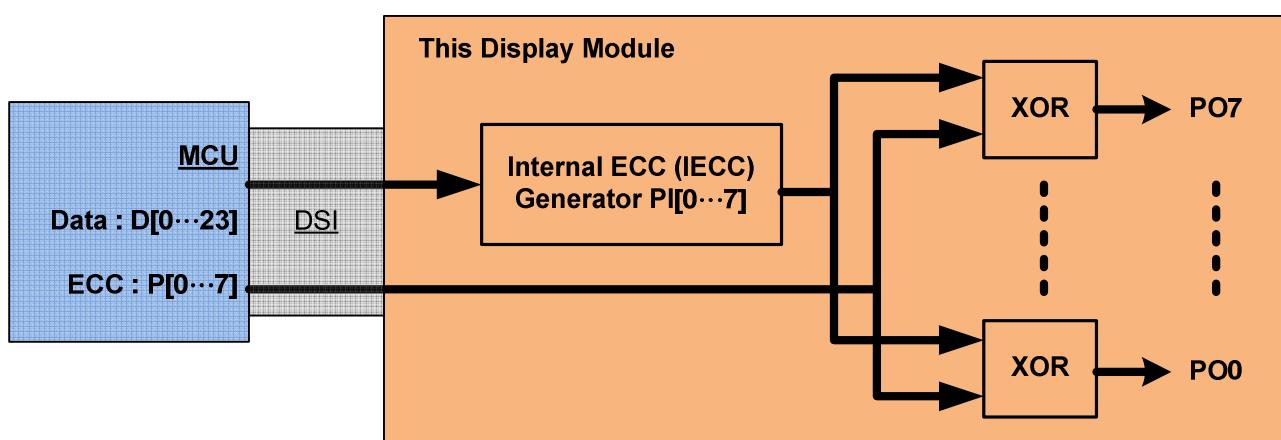

XOR Functionality on the Short Packet (SPa)

XOR Functionality on the Long Packet (LPa)

The transmitter (The MCU or the Display Module) is sending data bits D[23...0] and Error Correction Code (ECC) P[7...0]. The receiver (The Display module or the MCU) is calculate an Internal Error Correction Code (IECC) and compares the received Error Correction Code (ECC) and the Internal Error Correction Code (IECC). This comparison is done when each power bit of ECC and IECC have been done XOR function. The result of this function is PO[7...0].

This functionality, where the transmitter is the MCU and the receiver is the display module, is illustrated for reference purposes below.

Internal Error Correction Code (IECC) on the Display Module (The Receiver)

The sent data bits (D[23...0]) and ECC (P[7...0]) are received correctly, if a value of the PO[7...0] is 00h. The sent data bits (D[23...0]) and ECC (P[7...0]) are not received correctly, if a value of the PO[7...0] is not 00h.

ECC P[7...0]	1	1	0	0	0	0	0	03h
IECC PI[7...0]	1	1	0	0	0	0	0	03h
XOR(ECC,IECC)	0	0	0	0	0	0	0	=00h=>No Error
=>PO[7...0]	L	S	B		M	S	B	

Internal XOR Calculation between ECC and IECC Values-No Error

ECC P[7...0]	1	1	0	0	0	0	0	0	03h
IECC PI[7...0]	1	1	1	1	0	0	0	0	0Fh
XOR(ECC,IECC)	0	0	1	1	0	0	0	0	=0Ch=> Error
=>PO[7...0]									
	L				M				
	S				S				
	B				B				

Internal XOR Calculation between ECC and IECC Values- Error

The received Error Correction Code (ECC) can be 00h when the Error Correction Code (ECC) functionality is not used for data values D[23...0] on the transmitter side.

The number of the errors (one or more) can be defined when the value of the PO[7...0] is compared to values on the following table.

Data Bit	PO7	PO6	PO5	PO4	PO3	PO2	PO1	PO0	Hex
D[0]	0	0	0	0	0	1	1	1	07h
D[1]	0	0	0	0	1	0	1	1	0Bh
D[2]	0	0	0	0	1	1	0	1	0Dh
D[3]	0	0	0	0	1	1	1	0	0Eh
D[4]	0	0	0	1	0	0	1	1	13h
D[5]	0	0	0	1	0	1	0	1	15h
D[6]	0	0	0	1	0	1	1	0	16h
D[7]	0	0	0	1	1	0	0	1	19h
D[8]	0	0	0	1	1	0	1	0	1Ah
D[9]	0	0	0	1	1	1	0	0	1Ch
D[10]	0	0	1	0	0	0	1	1	23h
D[11]	0	0	1	0	0	1	0	1	25h
D[12]	0	0	1	0	0	1	1	0	26h
D[13]	0	0	1	0	1	0	0	1	29h
D[14]	0	0	1	0	1	0	1	0	2Ah
D[15]	0	0	1	0	1	1	0	0	2Ch
D[16]	0	0	1	1	0	0	0	1	31h
D[17]	0	0	1	1	0	0	1	0	32h
D[18]	0	0	1	1	0	1	0	0	34h
D[19]	0	0	1	1	1	0	0	0	38h

D[20]	0	0	0	1	1	1	1	1Fh
D[21]	0	0	1	0	1	1	1	2Fh
D[22]	0	0	1	1	0	1	1	37h
D[23]	0	0	1	1	1	0	1	3Bh

One error is detected if the value of the PO[7...0] is on : One Bit Error Value of the Error Correction Code (ECC) and the receiver can correct this one bit error because this found value also defines what is a location of the corrupt bit e.g.

- PO[7...0] = 0Eh
- The bit of the data (D[23...0]), what is not correct, is D[3]

More than one error is detected if the value of the PO[7...0] is not on: One Bit Error Value of the Error Correction Code (ECC) e.g. PO[7...0] =

8.2.9.4 Packet Data (PD) on the Long Packet (LPa)

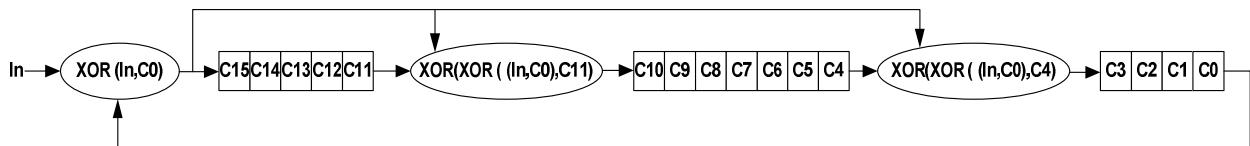

Packet Data (PD) of the Long Packet (LPa) is defined after Packet Header (PH) of the Long Packet (LPa). The number of the data bytes is defined on chapter “Word Count (WC) on the Long Packet (LPa)”.

8.2.9.5 Packet Footer (PF) on the Long Packet (LPa)

Packet Footer (PF) of the Long Packet (LPa) is defined after the Packet Data (PD) of the Long Packet (LPa). The Packet Footer (PF) is a checksum value what is calculated from the Packet Data of the Long Packet (LPa).

The checksum is using a 16-bit Cyclic Redundancy Check (CRC) value which is generated with a polynomial

$X^{16}+X^{12}+X^5+X^0$ as it is illustrated below.

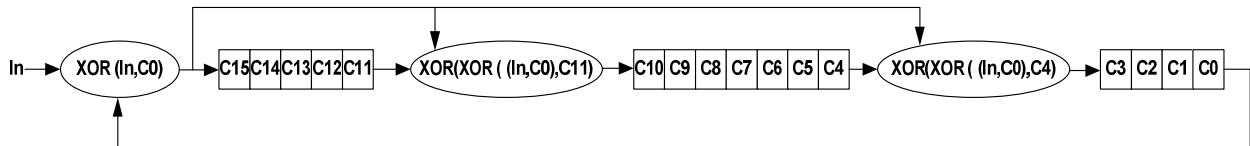

16-bit Cyclic Redundancy Check (CRC) Calculation

The 16-bit Cyclic Redundancy Check (CRC) generator is initialized to FFFFh before calculations. The Least Significant Bit (LSB) of the data byte of the Packet Data (PD) is the first bit what is inputted into the 16-bit Cyclic Redundancy Check (CRC).

An example of the 16-bit Cyclic Redundancy Check (CRC), where the Packet Data (PD) of the Long Packet (LPa) is

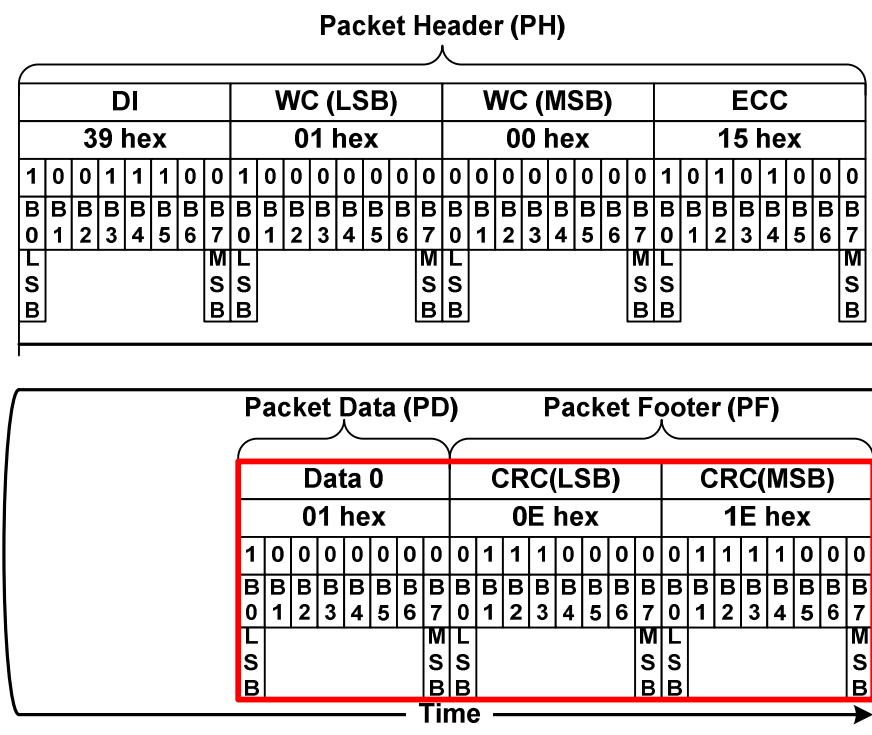

01h, is illustrated (step-by-step) below.

Step	In	XOR(In,C0)	C15	C14	C13	C12	C11	XOR(XOR(In,C0),C11(Step-1))	C10	C9	C8	C7	C6	C5	C4	XOR(XOR(In,C0),C4(Step-1))	C3	C2	C1	C0	C0
0	X	X	1	1	1	1	1	X	1	1	1	1	1	1	1	X	1	1	1	1	X
1	1(LSB)	0	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
2	0	1	1	0	1	1	1	0	0	1	1	1	1	1	1	0	0	1	1	1	1
3	0	1	1	1	0	1	1	0	0	0	1	1	1	1	1	0	0	1	1	1	1
4	0	1	1	1	1	0	1	0	0	0	1	1	1	1	1	0	0	0	1	1	1
5	0	1	1	1	1	1	0	0	0	0	1	1	1	1	1	0	0	0	0	0	0
6	0	0	1	1	1	1	1	0	0	0	0	0	1	1	1	1	1	0	0	0	0
7	0	0	0	1	1	1	1	1	1	0	0	0	0	0	0	1	1	0	0	0	0
8	0(MSB)	0	0	0	1	1	1	1	1	1	0	0	0	0	0	1	1	1	0	0	0
1 Byte		CRC	0	0	0	1	1		1	1	0	0	0	0	0		1	1	1	0	
		Result																			LSB
		LSB																			LSB

CRC Calculation – Packet Data (PD) is 01h

A value of the Packet Footer (PF) is 1E0Eh in this example. This example (Command 01h has been sent) is illustrated below.

Packet Footer (PF) Example

The receiver is calculated own checksum value from received Packet Data (PD). The receiver compares own checksum and the Packet Footer (PF) what the transmitter has sent.

The received Packet Data (PD) and Packet Footer (PF) are correct if the own checksum of the receiver and Packet Footer (PF) are equal and vice versa the received Packet Data (PD) and Packet Footer (PF) are not correct if the own checksum of the receiver and Packet Footer (PF) are not equal.

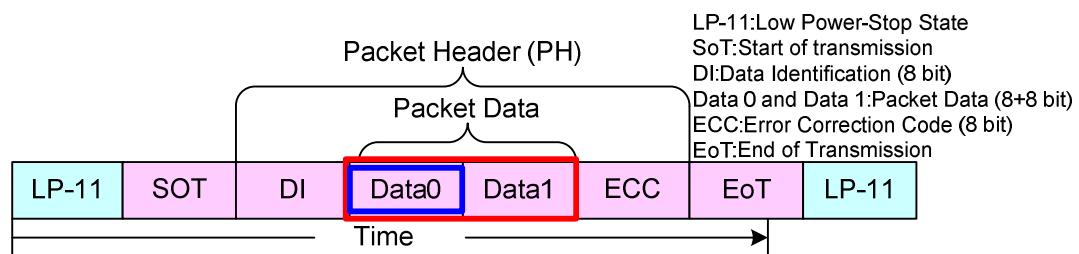

8.3. Packet Transmission

8.3.1 Packet from the MCU to the Display Module

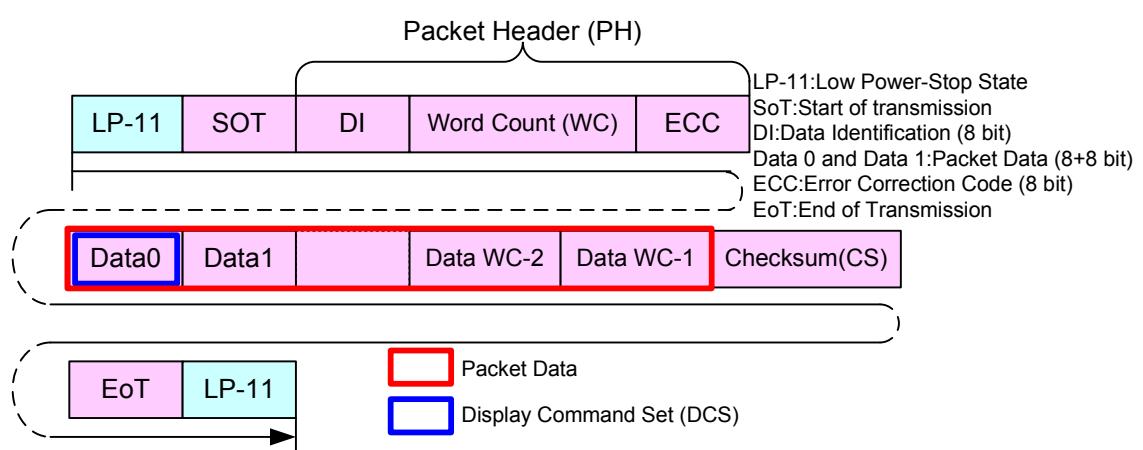

- Display Command Set (DCS)

Display Command Set (DCS), which is defined on chapter “9 Instruction Description”, is used from the MCU to the display module. This Display Command Set (DCS) is always defined on the Data 0 of the Packet Data (PD), which is included in Short Packet (SPa) and Long packet (LPa) as these are illustrated below.

Short Packet:

Long Packet:

Display Command Set (DCS) on Short Packet (SPa) and Long Packet (LPa)

- Generic Write, 1 Parameter (GENW1-S), Data Type = 01 0011 (13h)

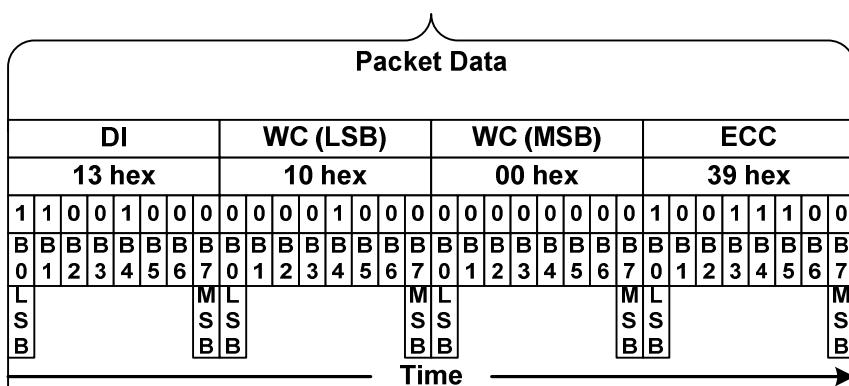

“Generic Write, 1 Parameter” (GENW1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0011b), from the MCU to the display module. The content of 2 payload bytes is “command” and 00h. These commands are defined on a table (See chapter “9 Instruction Description”) below

Command
NOP (00h)
SWRESET (01h)
SLPIN (10H)
SLPOUT (11h)
PTLON (12h)
NORON (13h)
INVOFF (20h)
INVON (21h)
ALLPOFF (22h)
ALLPON (23h)
DISPOFF (28h)
DISPON (29h)
IDMOFF (38h)
IDMON (39h)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 0011b
- Packet Data (PD)
 - Data 0: “Sleep In (10h)”, Display Command Set (DCS)
 - Data 1: Always 00hex
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

Generic Write,1 Parameter (GENW1-S)-Example

- Generic Write, 2 Parameter (GENW2-S), Data Type = 10 0011 (23h)

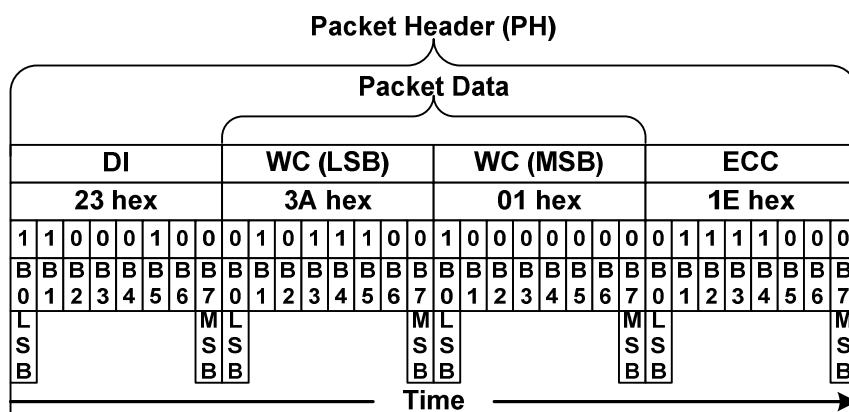

“Generic Write, 2 Parameter” (GENW2-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0011b), from the MCU to the display module. The content of 2 payload bytes is “command” and “parameter”. These commands are defined on a table (See chapter “6 Instruction Description”) below.

Command
GAMSET (26h)
COLMOD (3Ah)
WRDISBV (51h)
WRCTRLD (53h)
WRCABC (55h)
WRCABCMB (5Eh)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 0011b
- Packet Data (PD)
 - Data 0: “PMCSET (3Ah)”, Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

Generic Write, 2 Parameter (GENW2-S) – Example

- Generic Write Long (GENW-L) , Data Type = 10 1001 (29h)

“Generic Write Long” (GENW-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 10 1001b), from the MCU to the display module. Command (No Parameters) and Write (1 or more parameters), are defined on a table (See chapter “6 Instruction Description”) below.

Command		
NOP (00h) , Note1	INVON (21h) , Note1	IDMOFF (38h) , Note1
SWRESET (01h) , Note1	ALLPOFF (22h)	IDMON (39h) , Note1
SLPIN (10H) , Note1	ALLPON (23h)	COLMOD (3Ah) , Note2
SLPOUT (11h) , Note1	GAMSET (26h) , Note2	WRDISBV (51h) , Note2
PTLON (12h) , Note1	DISPOFF (28h) , Note1	WRCTRLD (53h) , Note2
NORON (13h) , Note1	DISPON (29h) , Note1	WRCABC (55h) , Note2
INVOFF (20h) , Note1	PARLINES (C5h)	WRCABCMB (5E) , Note2

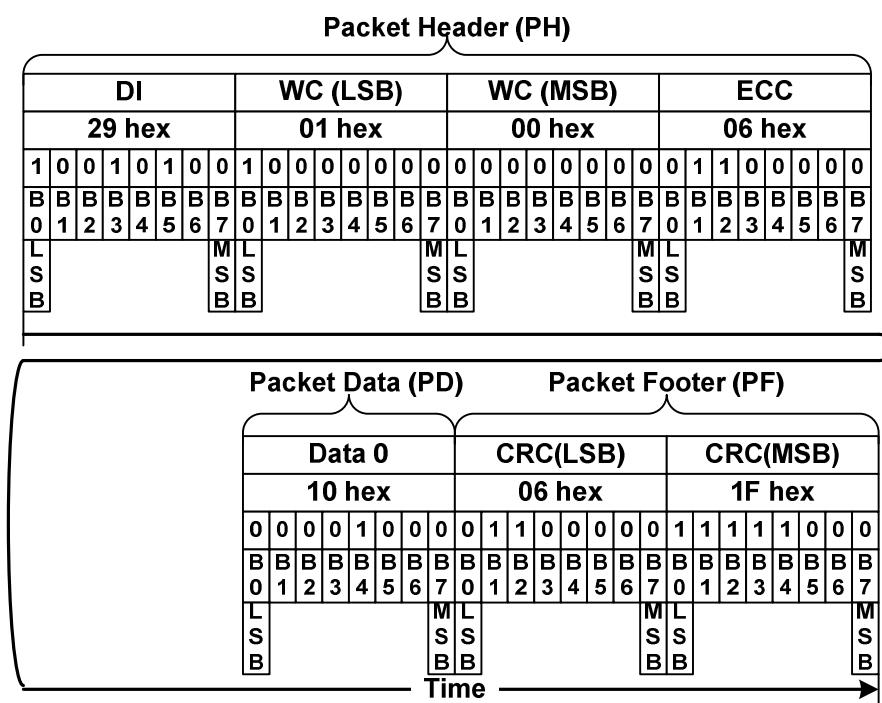

Notes : 1. Also Short Packet (SPa) can be used; See Generic Write, 1 Parameter.

2. Also Short Packet (SPa) can be used; See Generic Write, 2 Parameter.c

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 1001b
 - Word Count (WC)
 - Word Count (WC): 0001h
 - Error Correction Code (ECC)
 - Packet Data (PD): Data 0: “Sleep In (10h)”, Display Command Set (DCS)
 - Packet Footer (PF)

This is defined on the Long Packet (L_Pa) as follows.

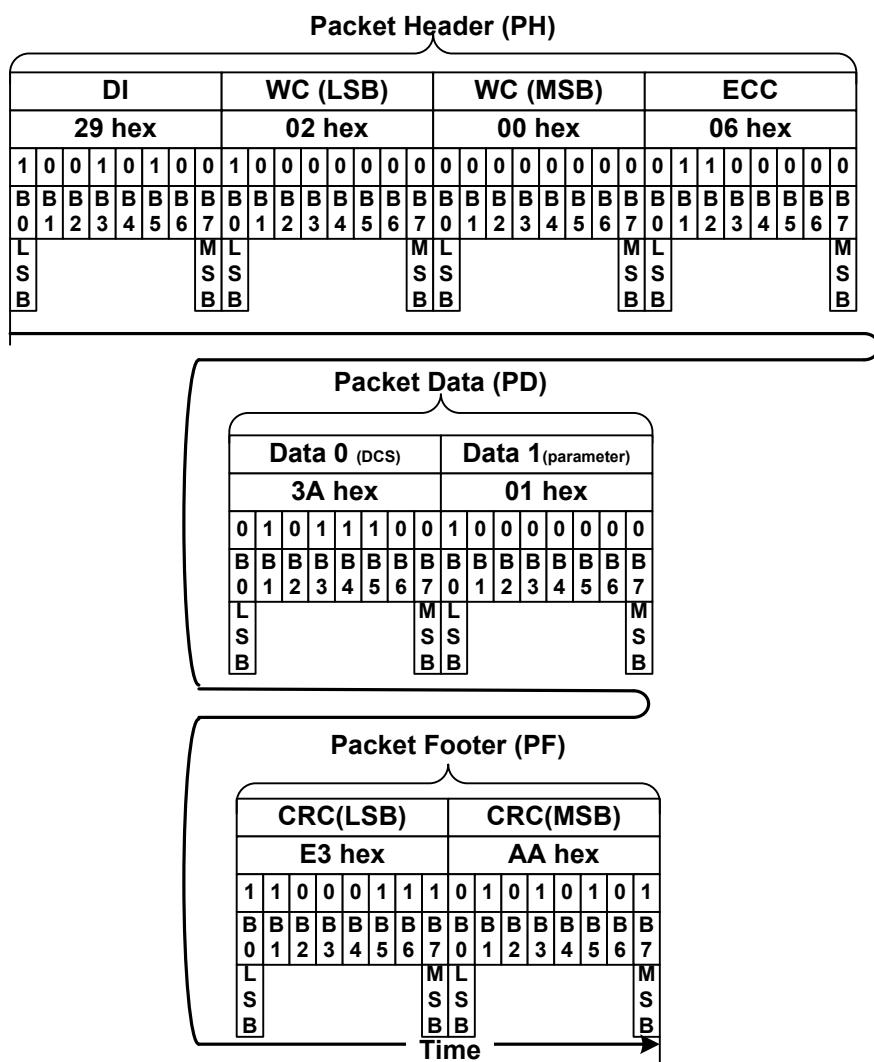

Generic Long Write(GENW-L) with DCS Only – Example

Long Packet (LPa), when a Write (1 parameter) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 1001b
- Word Count (WC)
 - Word Count (WC): 0002h
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: "Gamma Set (3Ah)", Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

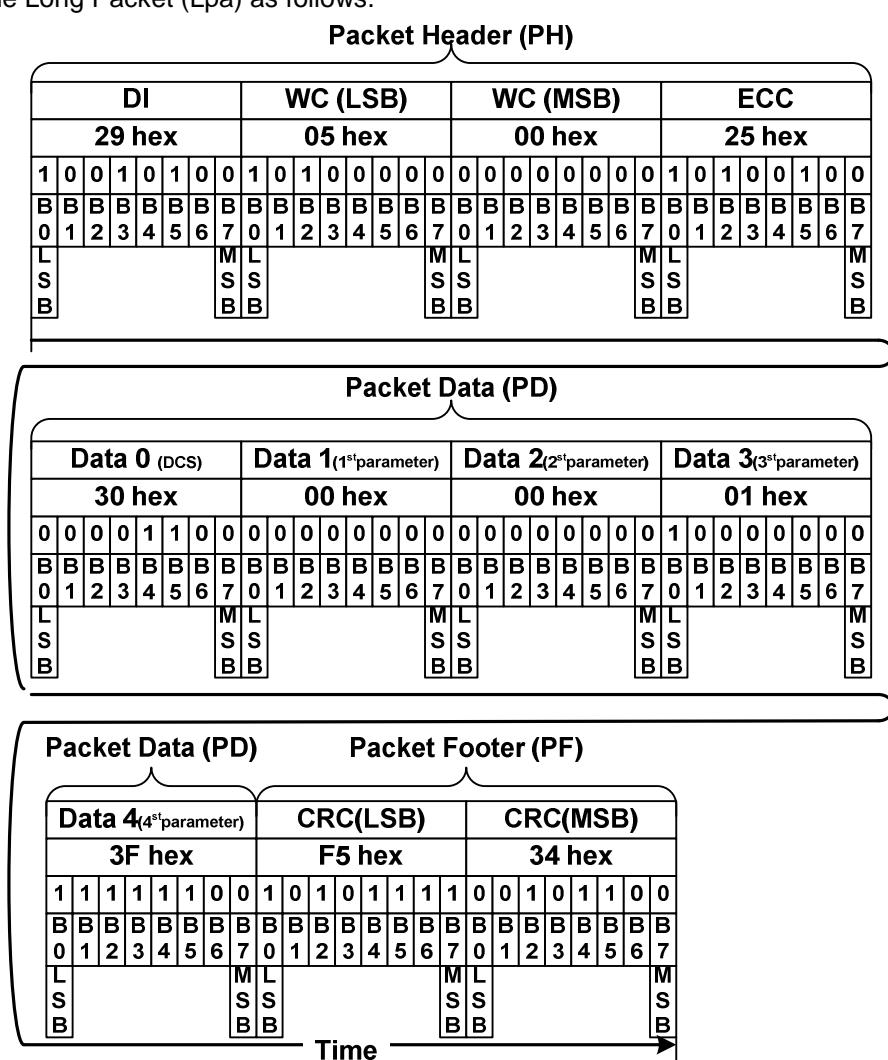

Generic Long Write (GENW-L) with DCS and 1 Parameter-Example

Long Packet (Lpa), when a Write (4 parameters) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 1001b
 - Word Count (WC)
 - Word Count (WC): 0005h
 - Error Correction Code (ECC)
 - Packet Data (PD):
 - Data 0: “PARLINES (30h)”, Display Command Set (DCS)
 - Data 1: 00hex, 1st Parameter of the DCS, Start Column SC[15...8]
 - Data 2: 00hex, 2nd Parameter of the DCS, Start Column SC[7...0]
 - Data 3: 01hex, 3rd Parameter of the DCS, End Column EC[15...8]
 - Data 4: 3Fhex, 4th Parameter of the DCS, End Column EC[7...0]
 - Packet Factor (PF)

This is defined on the Long Packet (lpa) as follows

Generic Write Long (GENW-L) with DCS and 4 Parameters-Example

- Generic Read , 1 Parameter (GENR1-S) , Data Type = 01 0100 (14h)

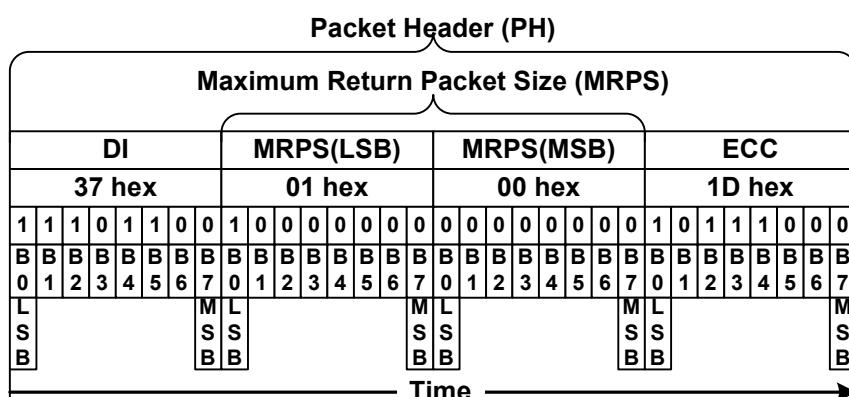

"Generic Read, 1 Parameter (GENR1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT,01 0100b), from the MCU to the display module. This command is defined on a table (See chapter "9 Instruction Description") below.

Command	
RDDID (04h)	RDDSM (0Eh)
RDNUMED (05h)	RDDSDR (0Fh)
RDRED (06h)	RDDISBV (52h)
RDGREEN (07h)	RDCTRLD (54h)
RDBLUE (08h)	RDCABC (56h)
RDDPM (0Ah)	RDCABCMB (5Fh)
RDDMADCTR (0Bh)	RDID1 (DAh)
RDDCOLMOD (0Ch)	RDID2 (DBh)
RDDIM (0Dh)	RDID3 (DCh)

The MCU has to define to the display module, what is the maximum size of the return packet. A command, what is used for this purpose, is "Set Maximum Return Packet Size" (SMRPS-S), which Data Type (DT) is 11 0111b and which is using Short Packet (SPa) before the MCU can send "Display Command Set (DCS) Read, No Parameter" to the display module. This same sequence is illustrated for reference purposes below.

Step 1:

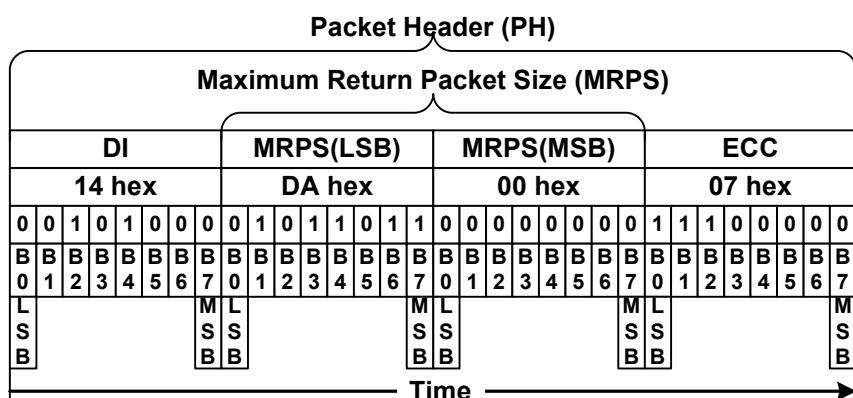

- The MCU sends "Set Maximum Return Packet Size" (Short Packet (SPa)) (SMRPS-S) to the display module when it wants to return one byte from the display module
- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 11 0111b
- Maximum Return Packet Size (MRPS)
 - Data 0: 01hex
 - Data 1: 00hex
- Error Correction Code (ECC)

Set Maximum Return Packet Size (SMRPS-S)- Example

Step 2:

- The MCU wants to receive a value of the “Read ID1 (DAh)” from the display module when the MCU sends “Generic Read, 1 Parameter” to the display module
 - Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 0100b
 - Packet Data (PD)
 - Data 0: “Read ID1 (DAh)”, Display Command Set (DCS)
 - Data 1: Always 00hex
 - Error Correction Code (ECC)

Generic Read, 1 Parameter (GENR1-S) – Example

Step 3: The display module can send 2 different information to the MCU after Bus Turnaround (BTA)

1. An acknowledge with Error Report (AwER), which is using a Short Packet (SPa), if there is an error to receive a command. See section “Acknowledge with Error Report (AwER)”.
2. Information of the received command. Short Packet (SPa) or Long Packet (LPa)

- Display Command Set (DCS) Write, No Parameter (DCSWN-S) , Data Type = 00 0101 (05h)

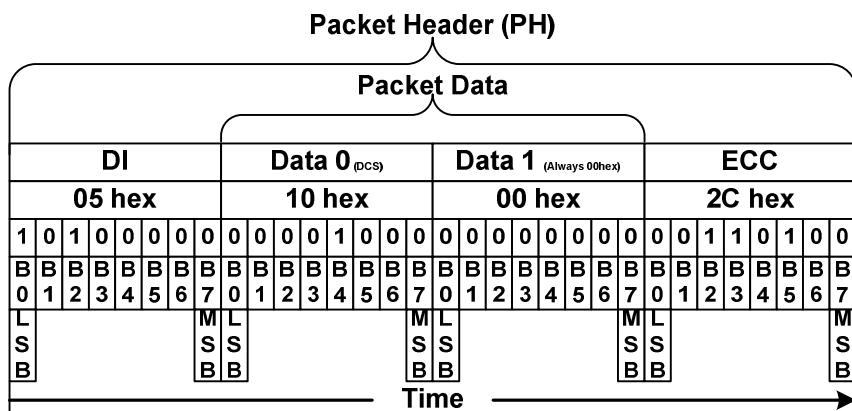

“Display Command Set (DCS) Write, No Parameter” is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0101b), from the MCU to the display module. These commands are defined on a table (See chapter “9 Instruction Description”) below.

Command	
NOP (00h)	INVON (21h)
SWRESET (01h)	ALLPOFF (22h)
SLPIN (10h)	ALLPON (23h)
SLPOUT (11h)	DISPOFF (28h)
PTLON (12h)	DISPON (29h)
NORON (13h)	IDMOFF (38h)
INVOFF (20h)	IDMON (39h)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 00 0101b
 - Packet Data (PD)
 - Data 0: “Sleep In (10h)”, Display Command Set (DCS)
 - Data 1: Always 00hex
 - Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

Display Command Set (DCS) Write,No Parameter(DCSWN-S)-Example

- Display Command Set (DCS) Write, 1 Parameter (DCSW1-S) , Data Type = 01 0101 (15h)

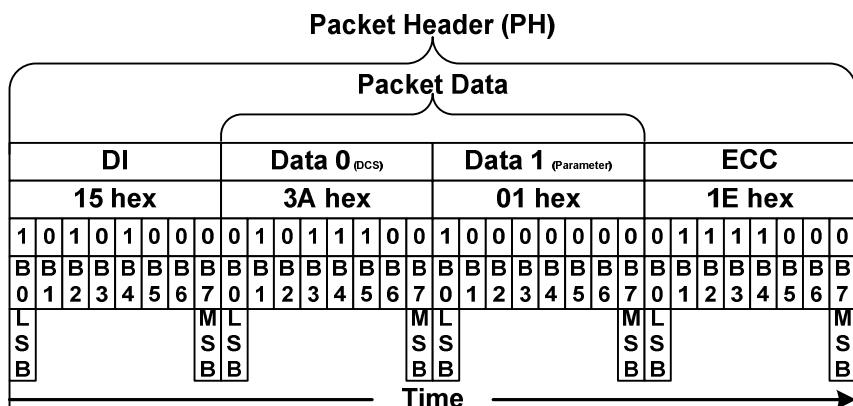

“Display Command Set (DCS) Write, 1 Parameter” (DCSW1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0101b), from the MCU to the display module. These commands are defined on a table (See chapter “9 Instruction Description”) below.

Command
GAMSET (26h)
COLMOD (3Ah)
WRDISBV (51h)
WRCTRLD (53h)
WRCABC (55h)
WRCABCM (5Eh)

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 0101b
- Packet Data (PD)
 - Data 0: “PMCSET (3Ah)”, Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

Display Command Set (DCS) Write,1 Parameter (DCSW1-S)-Example

- Display Command Set (DCS) Write Long (DCSW-L) , Data Type = 11 1001 (39h)

“Display Command Set (DCS) Write Long” (DCSW-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 11 1001b), from the MCU to the display module. Command (No Parameters) and Write (1 or more parameters), are defined on a table (See chapter “9 Instruction Description”) below

Command		
NOP (00h) , Note1	INVON (21h) , Note1	COLMOD (3Ah) , Note2
SWRESET (01h) , Note1	GAMSET (26h) , Note2	WRDISBV (51h), Note2
SLPIN (10h) , Note1	DISPOFF (28h) , Note1	WRCTRLD (53h)
SLPOUT (11h) , Note1	DISPON (29h), Note1	WRCABC (55h) , Note2
PTLON (12h) , Note1	PARLINES (30h)	WRCABCM (5Eh)
NORON (13h), Note1	IDMOFF (38h) , Note1	-
INVOFF (20h), Note1	IDMON (39h) , Note1	-

Notes : 1. Also Short Packet (SPa) can be used; See _Display Command Set (DCS) Write, No Parameter.

2. Also Short Packet (SPa) can be used; See Display Command Set (DCS) Write, 1 Parameter.

Long Packet (LPa), when a command (No Parameter) was sent, is defined e.g.

- Data Identification (DI)

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 11 1001b

- Word Count (WC)

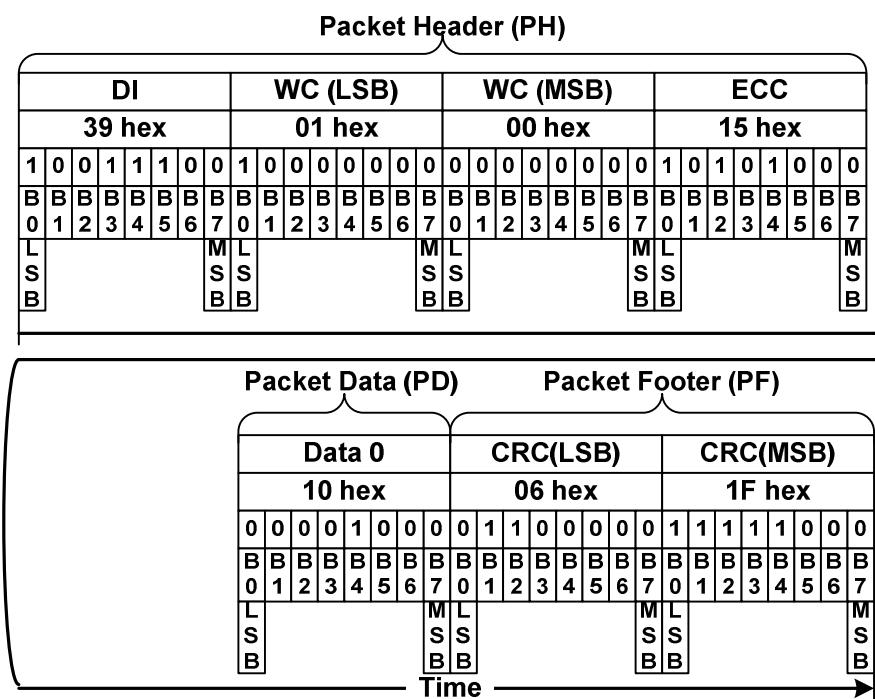

- Word Count (WC): 0001h

- Error Correction Code (ECC)

- Packet Data (PD): Data 0: “Sleep In (10h)”, Display Command Set (DCS)

- Packet Footer (PF)

This is defined on the Short Packet (SPa) as follows.

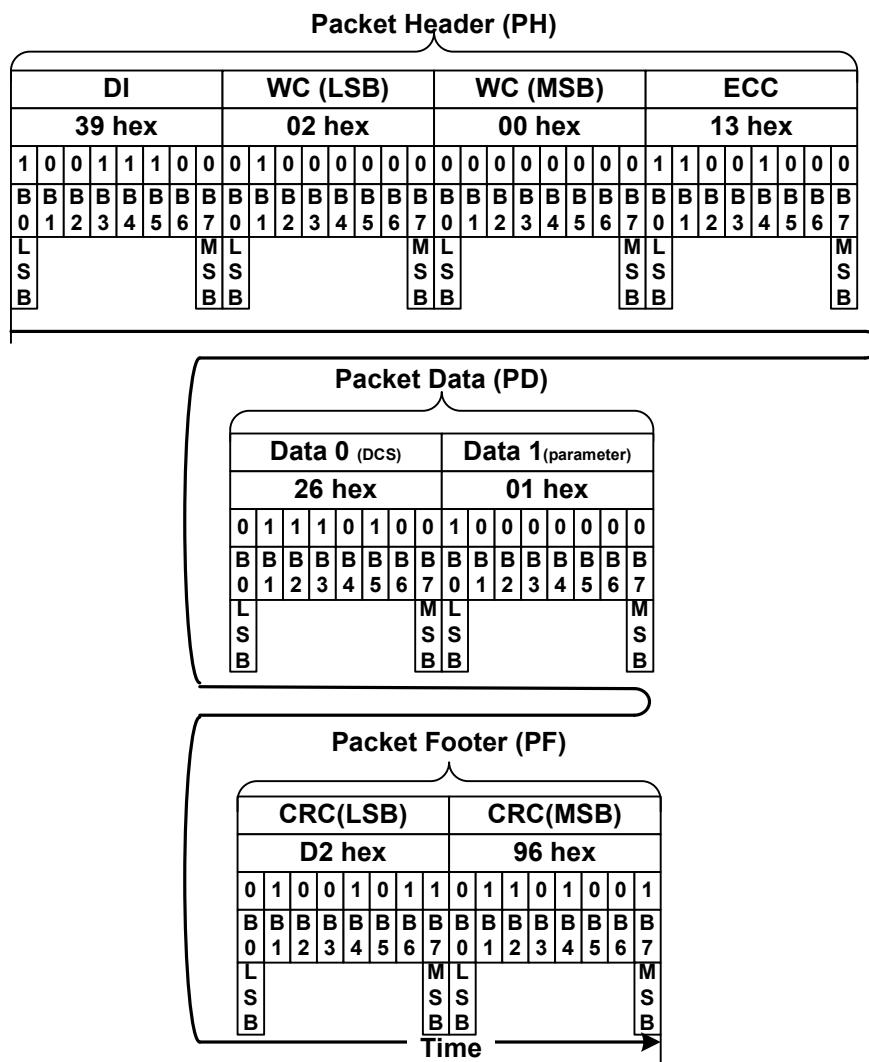

Display Command Set (DCS) Write Long (DCSW-L) with DCS Only-Example

Long Packet (LPA), when a Write (1 parameter) was sent, is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 11 1001b
- Word Count (WC)
 - Word Count (WC): 0002h
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: "Gamma Set (26h)", Display Command Set (DCS)
 - Data 1: 01hex, Parameter of the DCS
- Packet Footer (PF)

This is defined on the Short Packet (SPa) as follows

Display Command Set (DCS) Write Long with DCS and 1 Parameter-Example

Long Packet (LPA), when a Write (4 parameters) was sent, is defined e.g.

- Data Identification (DI)

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 11 1001b

- Word Count (WC)

- Word Count (WC): 0005h

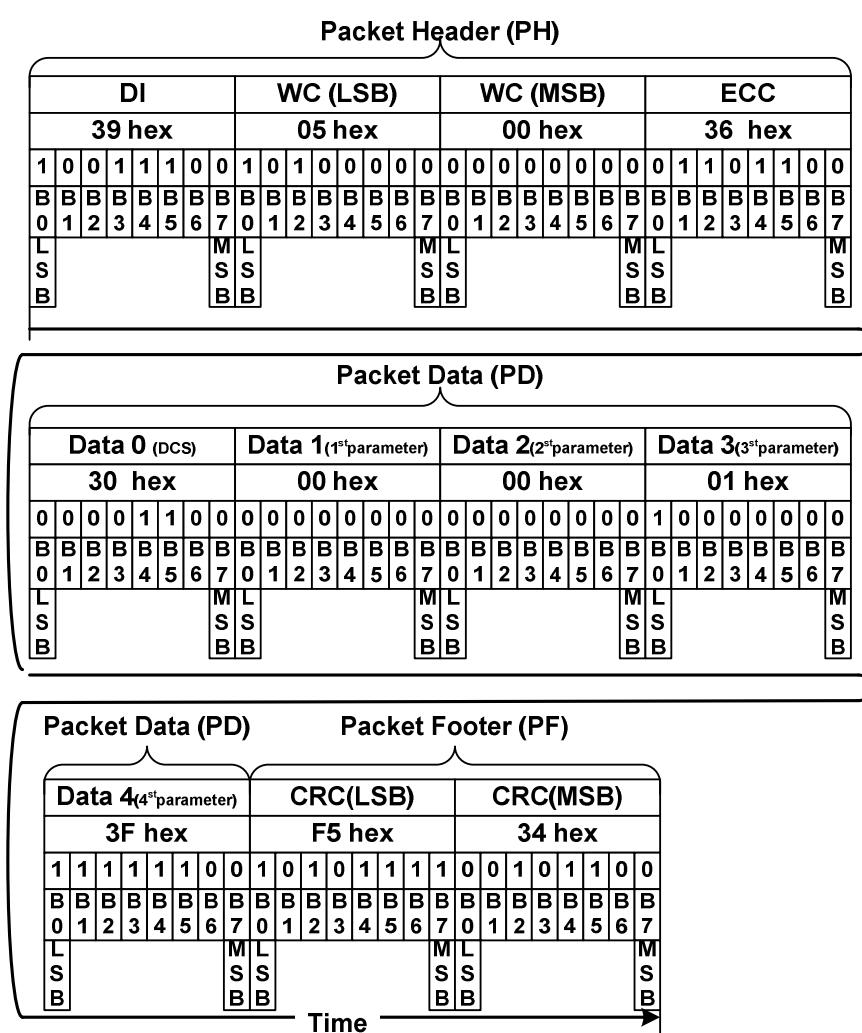

- Error Correction Code (ECC)

- Packet Data (PD):

- Data 0: "PARLINES (30h)", Display Command Set (DCS)
- Data 1: 00hex, 1st Parameter of the DCS, Start Column SC[15...8]
- Data 2: 00hex, 2nd Parameter of the DCS, Start Column SC[7...0]
- Data 3: 01hex, 3rd Parameter of the DCS, End Column EC[15...8]
- Data 4: 3Fhex, 4th Parameter of the DCS, End Column EC[7...0]

- Packet Footer (PF)

This is defined on the Short Packet (SPa) as follows.

Display Command Set (DCS) Write Long with DCS and 4 Parameters-Example

- Display Command Set (DCS) Read, No Parameter (DCSRN-S), Data Type = 00 0110 (06h)

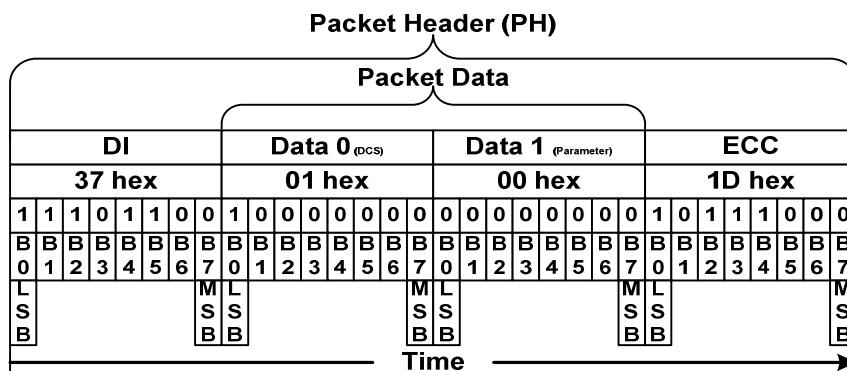

“Display Command Set (DCS) Read, No Parameter” (DCSRN-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 00 0110b), from the MCU to the display module. These commands are defined on a table (See chapter “9 Instruction Description”) below.

Command	
RDDID (04h)	RDDSM (0Eh)
RDNUMED (05h)	RDDSDR (0Fh)
RDRED (06h)	RDDISBV (52h)
RDGREEN (07h)	RDCTRLD (54h)
RDBLUE (08h)	RDCABC (56h)
RDDPM (0Ah)	RDCABCM (5Fh)
RDDMADCTR (0Bh)	RDID1 (DAh)
RDDCOLMOD (0Ch)	RDID2 (DBh)
RDDIM (0Dh)	RDID3 (DCh)

The MCU has to define to the display module, what is the maximum size of the return packet. A command, what is used for this purpose, is “Set Maximum Return Packet Size” (SMRPS-S), which Data Type (DT) is 11 0111b and which is using Short Packet (SPa) before the MCU can send “Display Command Set (DCS) Read, No Parameter” to the display module. This same sequence is illustrated for reference purposes below.

Step 1:

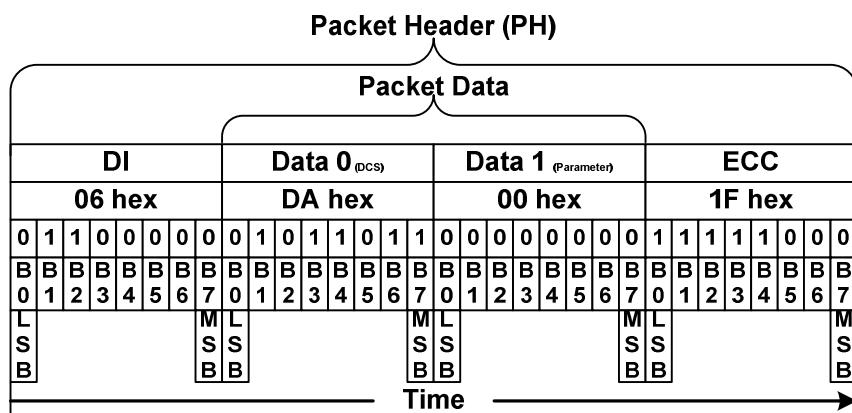

- The MCU sends “Set Maximum Return Packet Size” (Short Packet (SPa)) (SMRPS-S) to the display module when it wants to return one byte from the display module
- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 11 0111b
- Maximum Return Packet Size (MRPS)
 - Data 0: 01hex
 - Data 1: 00hex
- Error Correction Code (ECC)

Set Maximum Return Packet Size (SMRPS-S) - Example

Step 2:

- The MCU wants to receive a value of the “Read ID1 (DAh)” from the display module when the MCU sends “Display Command Set (DCS) Read, No Parameter” to the display module
- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 00 0110b
- Packet Data (PD)
 - Data 0: “Read ID1 (DAh)”, Display Command Set (DCS)
 - Data 1: Always 00hex
- Error Correction Code (ECC)

Display Command Set (DCS) Read, No Parameter (DCSRN-S) – Example

Step 3: The display module can send 2 different information to the MCU after Bus Turnaround (BTA)

- An acknowledge with Error Report (AwER), which is using a Short Packet (SPa), if there is an error to receive a command. See section “Acknowledge with Error Report (AwER)”.
- Information of the received command. Short Packet (SPa) or Long Packet (LPa)

- Null Packet, No Data (NP-L) , Data Type = 00 1001 (09h)

“Null Packet, No Data” (NP-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 001001b),from the MCU to the display module. The purpose of this command is keeping data lanes in the high speed mode (HSDT), if it is needed. The display module is ignored Packet Data (PD) what the MCU is sending.

Long Packet (LPa), when 5 random data bytes of the Packet Data (PD) were sent, is defined e.g.

- Data Identification (DI)

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 00 1001b

- Word Count (WC)

- Word Count (WC): 0005h

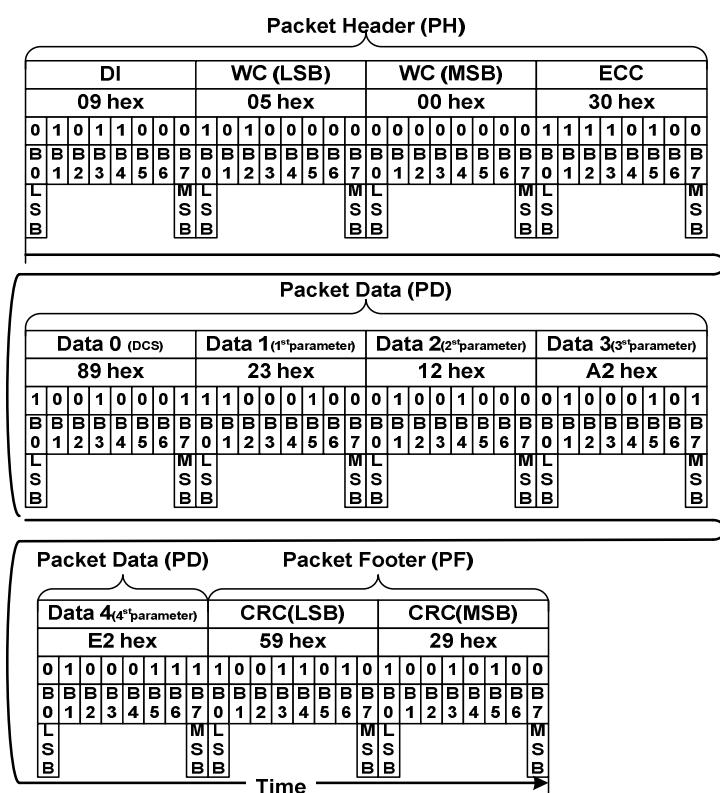

- Error Correction Code (ECC)

- Packet Data (PD):

- Data 0: 89h (Random data)
- Data 1: 23h (Random data)
- Data 2: 12h (Random data)
- Data 3: A2h (Random data)
- Data 4: E2h (Random data)

- Packet Footer (PF)

This is defined on the Long Packet (LPa) as follows.

Null Packet, No Data (NP-L)-Example

- End of Transmission Packet (EoTP), Data Type = 00 1000 (08h)

“End of Transmission Packet” (EoTP) is always using a Short Packet (SPa), what is defined on Data Type (DT, 001000b), from the MCU to the display module. The purpose of this command is terminated the high speed mode (HPDT) properly when there is added this extra packet after the last payload packet before “End of Transmission” (EoT), which is an interface level functionality.

The MCU can decide if it want to use the “End of Transmission Packet” (EoTP) or not. The ST7701S has the capability to support both: i.e. If MCU applies the EoTP, it shall report the “DSI Protocol Violation” error when the EoTP is not detected in the high speed (HS). This error reporting can be enable/disable by bit DIS_EoTP_HS of command B100h (page 0).

The display module is or isn't receiving “End of Transmission Packet” (EoTP) from the MCU during the Low Power Data Transmission (LPDT) mode before “Marked-1” (=leaving Escape mode) what ends the Low Power Data Transmission (LPDT) mode.

The display module is not allowed to send “End of Transmission Packet” (EoTP) to MCU during the Low Power Data Transmission (LPDT) mode.

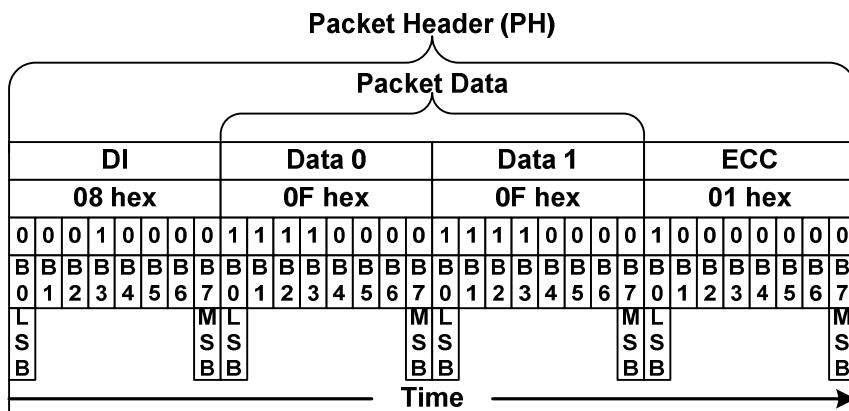

The summary of the receiving and transmitting EoTP is listed below.

Direction	Display Module (DM) in High Speed Data Transmission (HPDT)	Display Module (DM) in Low Power Data Transmission (LPDT)
MCU=>Display Driver	With or Without EoTP is Supported	With or Without EoTP is Supported
Display Driver=>MCU	HS Mode is not available (EoTP is not available)	EoTP can not be sent by the Display Driver

Receiving and Transmitting EoTP during LPDT

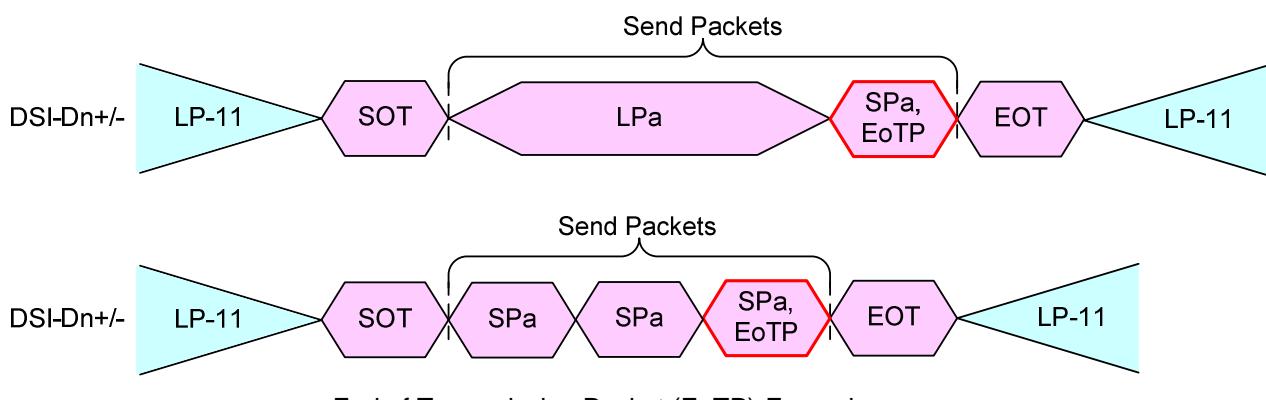

Short Packet (SPa) is using a fixed format as follow

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 00 1000b
- Packet Data (PD):
 - Data 0: 0Fh
 - Data 1: 0Fh
- Error Correction Code (ECC)
- ECC: 01h

End of Transmission Packet (EoTP)

Some use case of the “End of Transmission Packet” (EoTP) are illustrated only for reference purpose below.

End of Transmission Packet (EoTP)-Example

● Sync Event (H Start, H End, V Start, V End), Data Type = xx 0001 (x1h)

Sync Events are Short packets and, therefore, can time-accurately represent events like the start and end of sync pulses. As “start” and “end” are separate and distinct events, the length of sync pulses, as well as position relative to active pixel data, e.g. front and back porch display timing, may be accurately conveyed to the peripheral. The Sync Events are defined as follows:

- Data Type = 00 0001 (01h) V Sync Start • Data Type = 01 0001 (11h) V Sync End
- Data Type = 10 0001 (21h) H Sync Start • Data Type = 11 0001 (31h) H Sync End

In order to represent timing information as accurately as possible a V Sync Start event represents the start of the VSA and also implies an H Sync Start event for the first line of the VSA. Similarly, a V Sync End event implies an H Sync Start event for the last line of the VSA..

Sync events should occur in pairs, Sync Start and Sync End, if accurate 1054 pulse-length information needs to be conveyed. Alternatively, if only a single point (event) in time is required, a single sync event (normally, Sync Start) may be transmitted to the peripheral. Sync events may be concatenated with blanking packets to

convey inter-line timing accurately and avoid the overhead of switching between LPS and HS for every event. Note there is a power penalty for keeping the data line in HS mode, however. Display modules that do not need traditional sync/blanking/pixel timing should transmit pixel data in a high-speed burst then put the bus in Low Power Mode, for reduced power consumption. The recommended burst size is a scan line of pixels, which may be temporarily stored in a line buffer on the display module.

- Color Mode On Command, and, Data Type = 01 0010 (12h)

Color Mode On is a Short packet command that switches a Video Mode display module to 8-colors mode for power saving.

- Color Mode Off Command, Data Type = 00 0010 (02h)

Color Mode Off is a Short packet command that returns a Video Mode display module from 8-colors mode to normal display operation.

- Shutdown Peripheral Command, Data Type = 10 0010 (22h)

Shutdown Peripheral command is a Short packet command that turns off the display in a Video Mode display module for power saving. Note the interface shall remain powered in order to receive the turn-on, or wake-up, command.

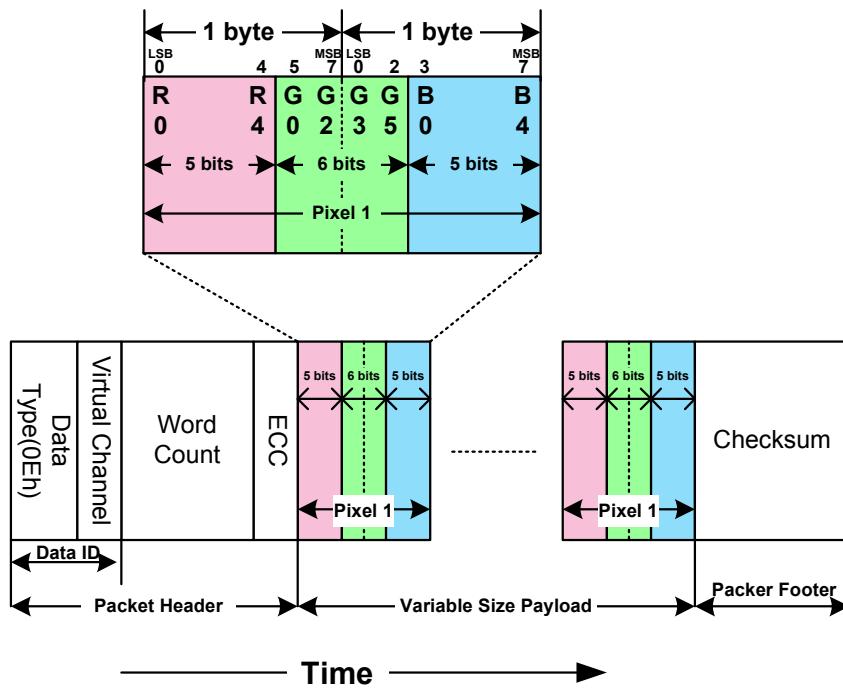

- Turn On Peripheral Command, Data Type = 11 0010 (32h)

Turn On Peripheral command is Short packet command that turns on the display in a Video Mode display module for normal display operation.

- Blanking Packet (Long), Data Type = 01 1001 (19h)

A Blanking packet is used to convey blanking timing information in a Long packet. Normally, the packet represents a period between active scan lines of a Video Mode display, where traditional display timing is provided from the host processor to the display module. The blanking period may have Sync Event packets interspersed between blanking segments. Like all packets, the Blanking packet contents shall be an integer number of bytes. Blanking packets may contain arbitrary data as payload. The Blanking packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes, and a two-byte checksum.

- Packed Pixel Stream, 16-bit Format, Long packet, Data Type = 00 1110 (0Eh)

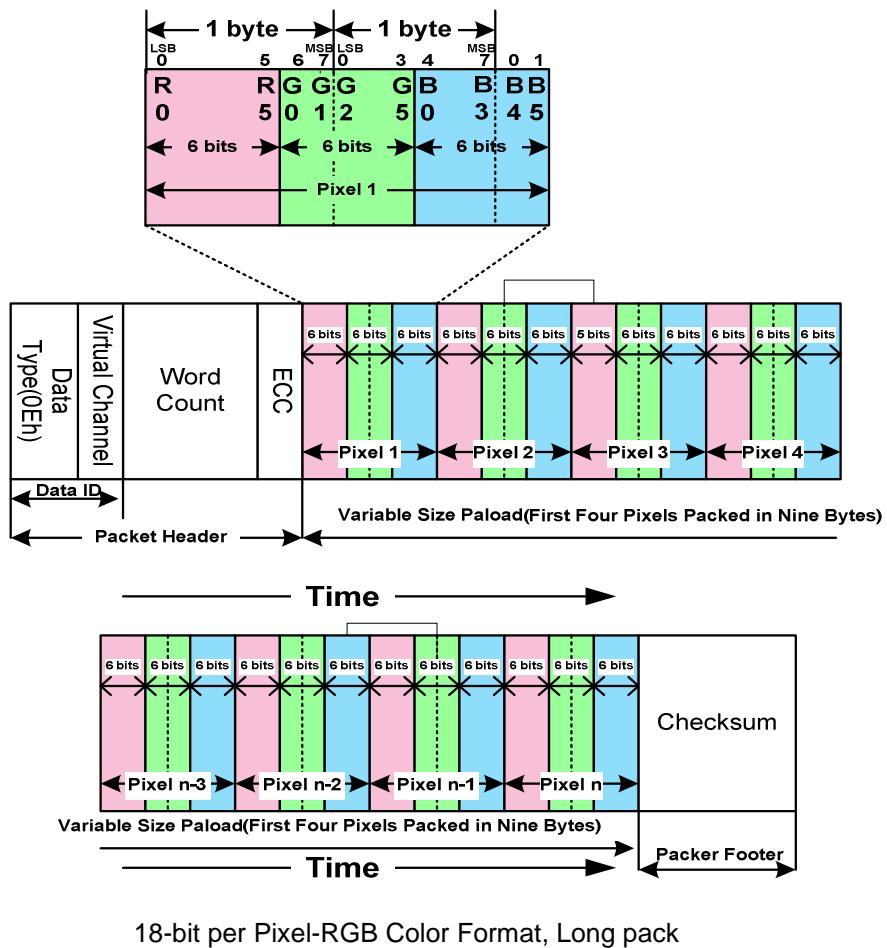

16-bit per Pixel-RGB Color Format, Long packet

Packed Pixel Stream 16-Bit Format is a Long packet used to transmit image data formatted as 16-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte checksum. Pixel format is five bits red, six bits green, five bits blue, in that order. Note that the “Green” component is split across two bytes. Within a color component, the LSB is sent first, the MSB last.

With this format, pixel boundaries align with byte boundaries every two bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of two bytes.

Normally, the display module has no frame buffer of its own, so all image data shall be supplied by the host processor at a sufficiently high rate to avoid flicker or other visible artifacts.

- Packed Pixel Stream, 18-bit Format, Long packet, Data type = 01 1110 (1Eh)

18-bit per Pixel-RGB Color Format, Long pack

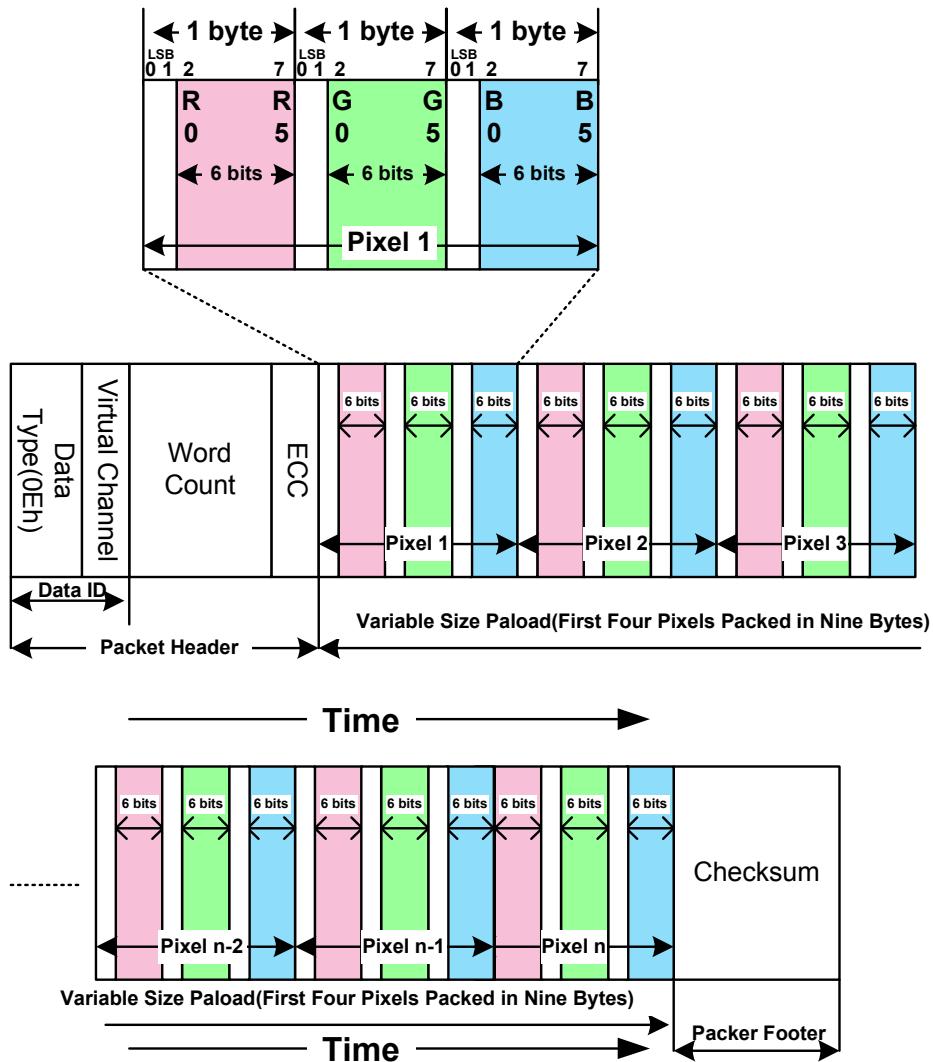

Packed Pixel Stream 18-Bit Format (Packed) is a Long packet. It is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. Pixel format is red (6 bits), green (6 bits) and blue (6 bits), in that order. Within a color component, the LSB is sent first, the MSB last.

Note that pixel boundaries only align with byte boundaries every four pixels (nine bytes). Preferably, display modules employing this format have a horizontal extent (width in pixels) evenly divisible by four, so no partial bytes remain at the end of the display line data. If the active (displayed) horizontal width is not a multiple of four pixels, the transmitter shall send additional fill pixels at the end of the display line to make the transmitted width a multiple of four pixels. The receiving peripheral shall not display the fill pixels when refreshing the display device.

For example, if a display device has an active display width of 399 pixels, the transmitter should send 400 pixels in one or more packets. The receiver should display the first 399 pixels and discard the last pixel of the transmission.

With this format, the total line width (displayed plus non-displayed pixels) should be a multiple of four pixels (nine bytes).

- Pixel Stream, 18-bit Format in Three Bytes, Long packet, Data Type = 101110 (2Eh)

18-bit per Pixel (Loosely Packed)-RGB Color Format, Long pack

In the 18-bit Pixel Loosely Packed format, each R, G, or B color component is six bits but is shifted to the upper bits of the byte, such that the valid pixel bits occupy bits [7:2] of each byte. Bits [1:0] of each payload byte representing active pixels are ignored. As a result, each pixel requires three bytes as it is transmitted across the Link. This requires more bandwidth than the “packed” format, but requires less shifting and multiplexing logic in the packing and unpacking functions on each end of the Link.

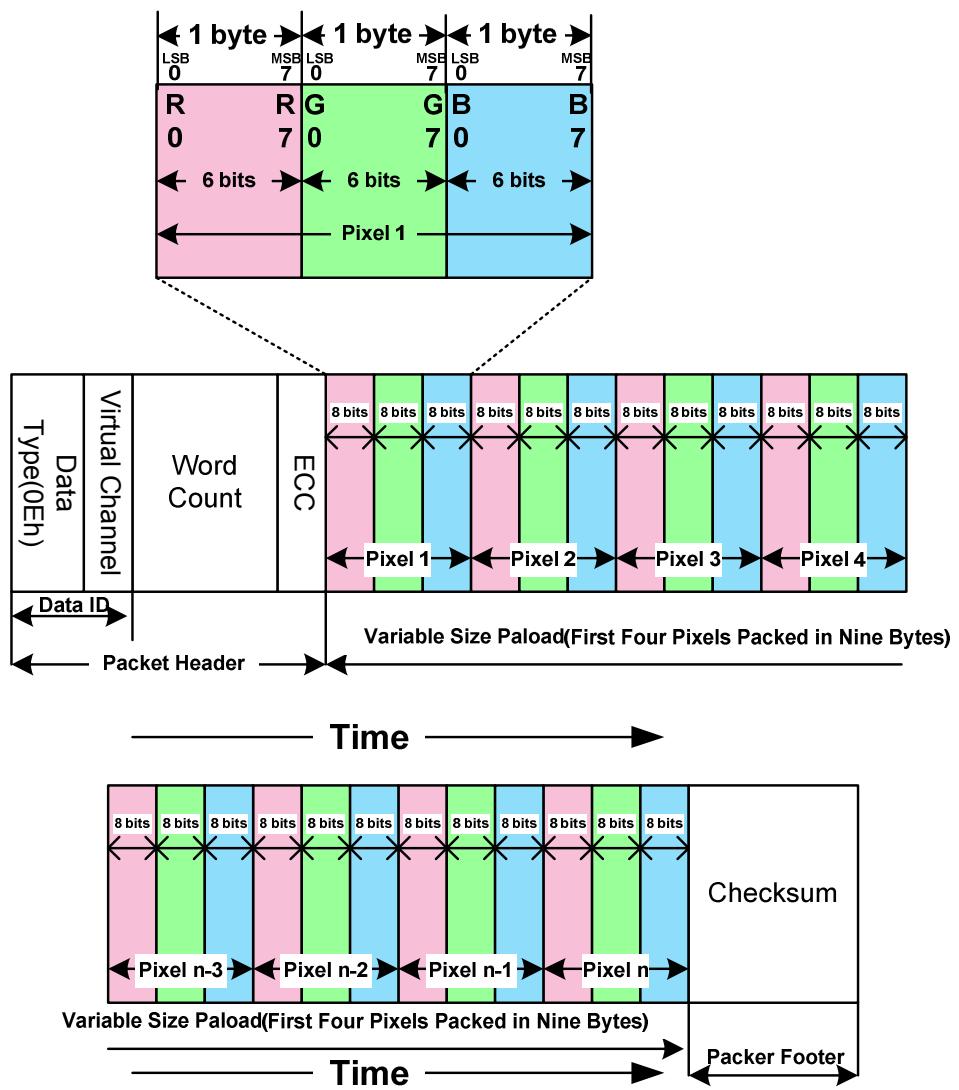

This format is used to transmit RGB image data formatted as pixels to a Video Mode display module that displays 18-bit pixels. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (6 bits), green (6 bits) and blue (6 bits) in that order. Within a color component, the LSB is sent first, the MSB last.

With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

- Packed Pixel Stream, 24-bit Format, Long packet, Data Type = 11 1110 (3Eh)

Packed Pixel Stream 24-Bit Format is a Long packet. It is used to transmit image data formatted as 24-bit pixels to a Video Mode display module. The packet consists of the DI byte, a two-byte WC, an ECC byte, a payload of length WC bytes and a two-byte Checksum. The pixel format is red (8 bits), green (8 bits) and blue (8 bits), in that order. Each color component occupies one byte in the pixel stream; no components are split across byte boundaries. Within a color component, the LSB is sent first, the MSB last.

With this format, pixel boundaries align with byte boundaries every three bytes. The total line width (displayed plus non-displayed pixels) should be a multiple of three bytes.

24-bit per Pixel -RGB Color Format, Long packet

8.3.2 Packet from the Display Module To The MCU

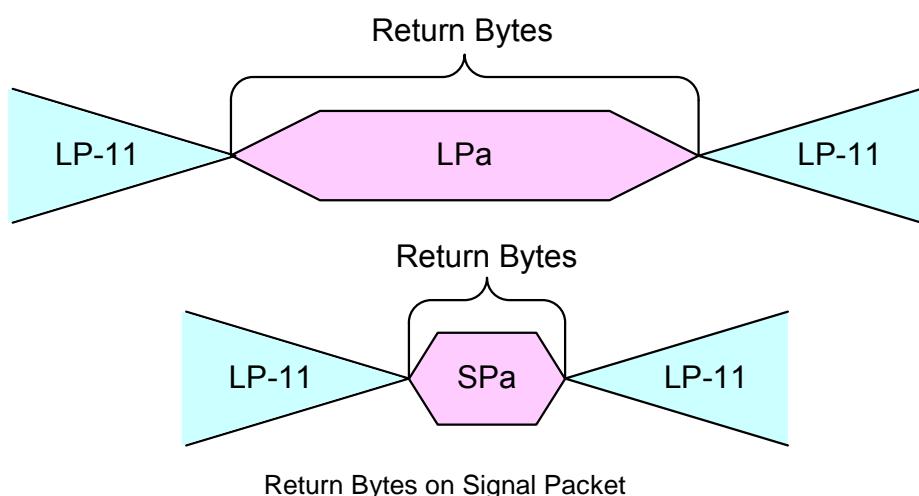

- Used Packet Types

The display module is always using Short Packet (SPa) or Long Packet (LPa), when it is returning information to the MCU after the MCU has requested information from the Display Module. This information can be a response of the Display Command Set (DCS) Read, No Parameter",(DCSRN-S)) or an Acknowledge with Error Report .The used packet type is defined on Data Type (DT)..

A number of the return bytes are more than the maximum size of the Packet Data (PD) on Long Packet (LPa) or Short Packet (SPa) when the display module is sending return bytes in several packets until all return bytes have been sent from the display module to the MCU.

It is not possible that the display module is sending return bytes in several packets even if the maximum size of the Packet Data (PD) could be sent on a packet.

Both cases are illustrated for reference purposes below.

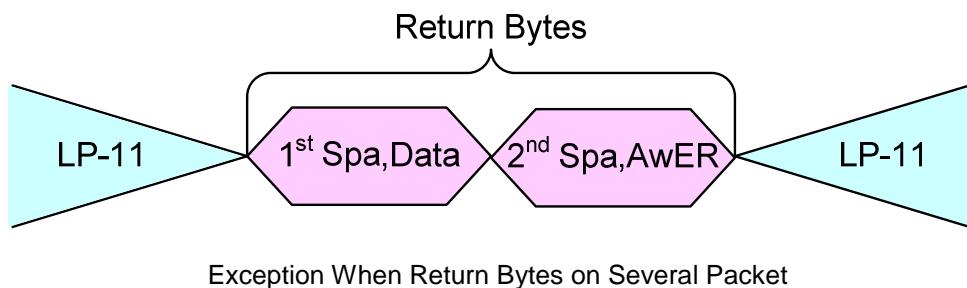

Data Type Hex	Data Type Binary	Symbol	Description	Packet Size
02h	00 0010	AwER	Acknowledge & Error Report	Short
1Ch	01 1100	DCSRR-L	DCS Long Read Response	Long
21h	10 0001	SCSRR1-S	DCS Short Read Response, 1 Byte returned	Short
22h	01 0010	DCSRR2-S	DCS Short Read Response, 2 Byte returned	Short
1Ah	01 1010	GENRR-L	Generic Long Read Response	Long
11h	01 0001	GENRR1-S	Generic Long Read Response, 1 Byte returned	Short
12h	01 0010	GENRR2-S	Generic Long Read Response, 2 Byte returned	Short

Data Type for Display Module-sourced Packets

The display module is return 2 packets (1st packet: Data, 2nd packet Acknowledge with Error Report) to the MCU when the display module has received a read command. See section "Display Command Set (DCS)

Read, No Parameter (DCSRN-S)" where has been detected and corrected a single bit error by the EEC (See bit 8 on Table" Acknowledge with Error Report (AwER) for Short Packet (SPa) Response"). This return packets are illustrated for reference purpose below.

AwER=Acknowledge with Error Report

- Acknowledge with Error Report (AwER), Data Type = 00 0010(02h)

"Acknowledge with Error Report" (AwER) is always using a Short Packet (SPa), what is defined on Data Type (DT,00 0010b), from the display module to the MCU.

The Packet Data (PD) can include bits, which are defining the current error, when a corresponding bit is set to '1',as they are defined on the following table.

Bit	Description
0	SoT Error
1	SoT Sync Error
2	EoT Sync Error
3	Escape Mode Entry Command Error
4	Low-Power Transmit Sync Error
5	Any Protocol Timer Time-Out
6	False Control Error
7	Contention is Detected on the Display Module
8	ECC Error, single-bit (detected and corrected)
9	ECC Error, multi-bit (detected, not corrected)
10	Checksum Error (Long packet only)
11	DSI Data Type (DT) Not Recognized
12	DSI Virtual Channel (VC) ID Invalid
13	Invalid Transmission Length
14	Reserved, Set to '0' internally
15	DSI Protocol Violation

Acknowledge with Error Report (AwER) for Long Packet (LPa) Response

Bit	Description
0	SoT Error
1	SoT Sync Error
2	EoT Sync Error
3	Escape Mode Entry Command Error
4	Low-Power Transmit Sync Error
5	Any Protocol Timer Time-Out
6	False Control Error
7	Contention is Detected on the Display Module
8	ECC Error, single-bit (detected and corrected)
9	ECC Error, multi-bit (detected, not corrected)
10	Set to "0" internally (Only for Long Packet (LP))
11	DSI Data Type (DT) Not Recognized
12	DSI Virtual Channel (VC) ID Invalid
13	Invalid Transmission Length
14	Reserved, Set to '0' internally
15	DSI Protocol Violation

Acknowledge with Error Report (AwER) for Short Packet (SPa) Response

These errors are only included on the last packet, which has been received from the MCU to the display module before Bus Turnaround (BTA).

The display module ignores the received packet which includes error or errors

Acknowledge with Error Report (AwER) of the Short Packet (SPa) is defined e.g.

- Data Identification (DI)

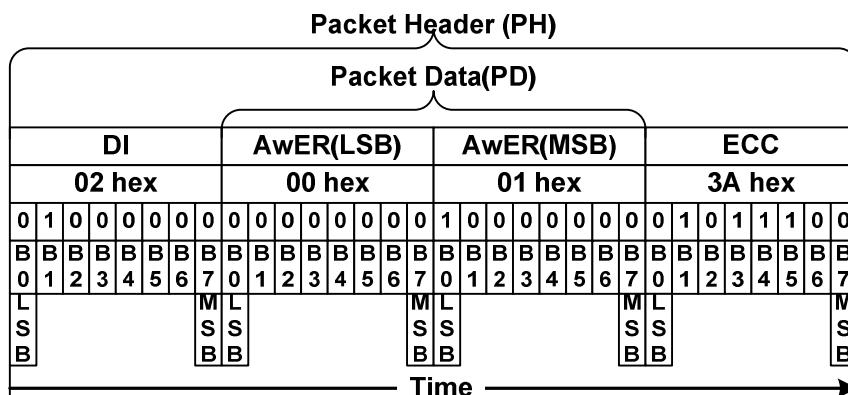

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 00 0010b

- Packet Data (PD):

- Bit 8: ECC Error, single-bit (detected and corrected)
- AwER: 0100h

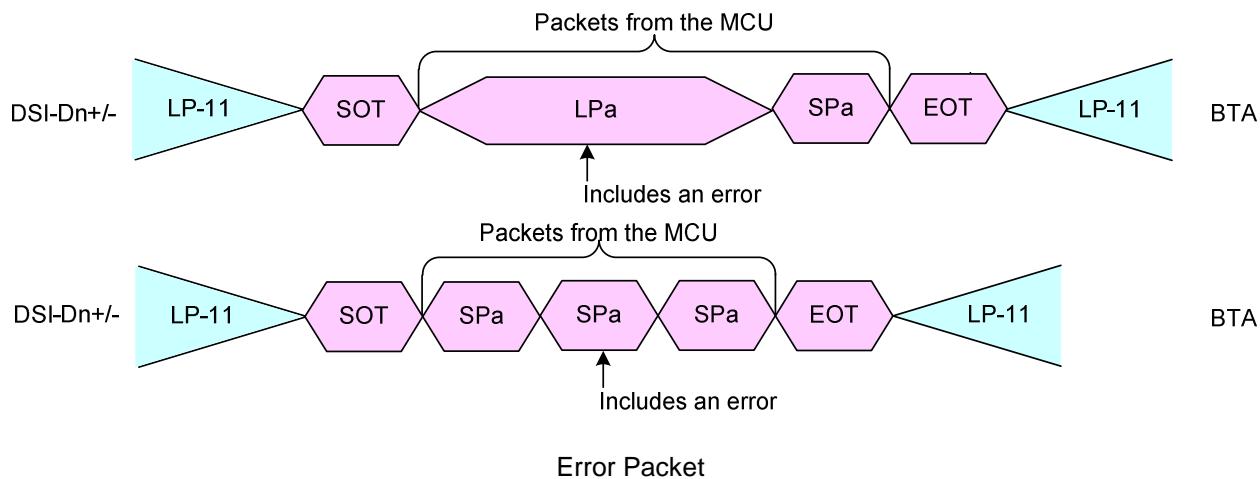

- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

Acknowledge with Error Report (AwER)-Example

It is possible that the display module receivers several packets, which include error, from the MPU before the MPU performs the Bus Turnaround (BTA). Some examples are illustrated below for reference purpose.

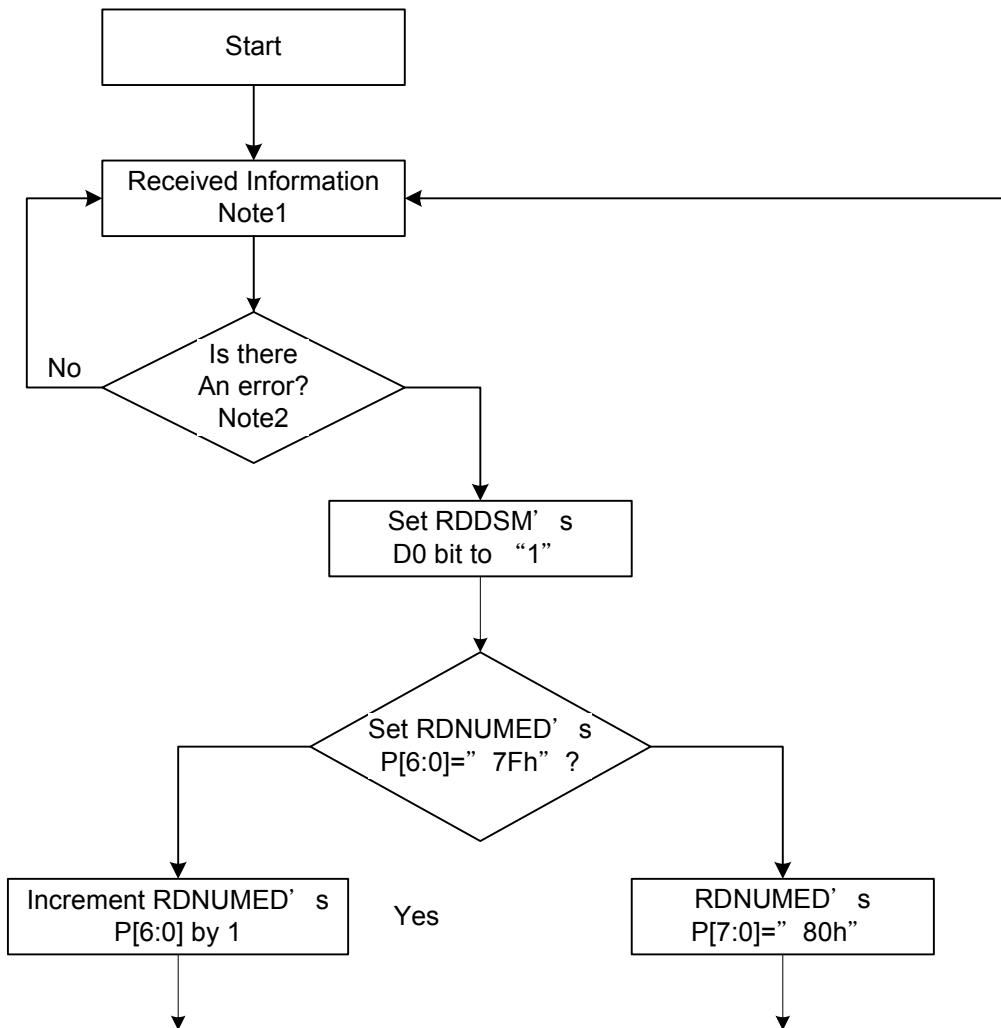

Therefore, there is needed a method to check if there has been errors on the previous packets. These errors of the previous packets can check “Read Display Signal Mode (0Eh)” and “Read Number of the Errors on DSI (05h)” commands.

The bit D0 of the “Read Display Signal Mode (0Eh)” command has been set to ‘1’ if a received packet includes an error.

The number of the packets, which are including an ECC or CRC error, are calculated on the RDNUMED register, which can read “Read Number of the Errors on DSI (05h)” command. This command also sets the RDNUMED register to 00h as well as set the bit D0 of the “Read Display Signal Mode (0Eh)” command to ‘0’ after the MCU has read the RDNUMED register from the display module.

The functionality of the RDNUMED register is illustrated for reference purposes below.

Notes:

1. This information can Interface or Packet Level Communication but it is always from the MCU to the display module in this case.
2. CRC or ECC err

- DCS Read Long Response (DCSRR-L), Data Type = 01 1100(1Ch)

“DCS Read Long Response” (DCSRR-L) is always using a Long Packet (LPa), what is defined on Data Type (DT,01 1100b), from the display module to the MCU. “DCS Read Long Response” (DCSRR-L) is used when the display module wants to response a DCS Read command, which the MCU has sent to the display module.

“DCS Read Long Response” (DCSRR-L) is used when the display module wants to response a DCS Read command, which the MCU has sent to the display module.

Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), is defined e.g.

- Data Identification (DI)

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 01 1100b

- Word Count (WC)

- Word Count (WC): 0005h

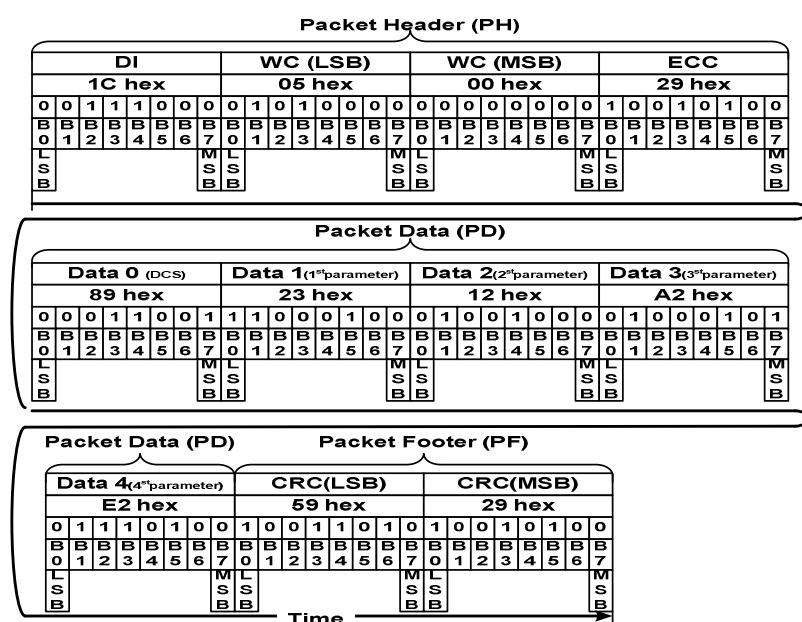

- Error Correction Code (ECC)

- Packet Data (PD):

- Data 0: 89h
- Data 1: 23h
- Data 2: 12h
- Data 3: A2h
- Data 4: E2h

- Packet Footer (PF)

This is defined on the Long Packet (LP) as follows.

DCS Read Long Response(DCSRR-L)-Example

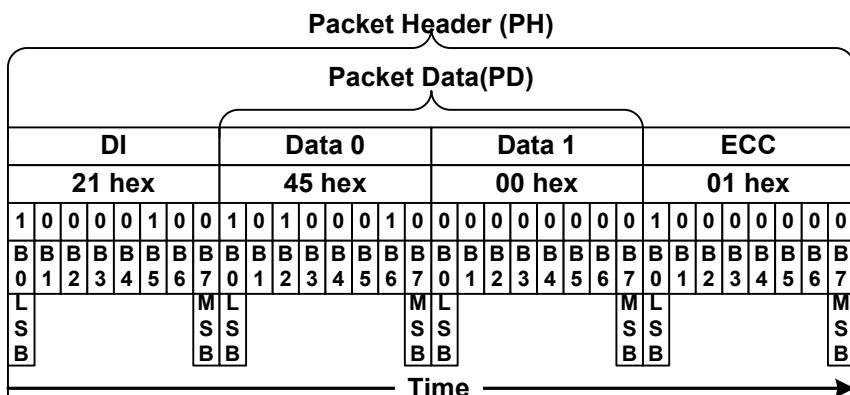

- DCS Read Short Response, 1 Byte Returned (DCSRR1-S), Data Type = 100001(21h)

"DCS Read Short Response, 1 Byte Returned" (DCSRR1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0001b), from the display module to the MCU. "DCS Read Short Response, 1 Byte Returned" (DCSRR1-S) is used when the display module wants to response a DCS Read command, which the MCU has sent to the display module.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 0001b
 - Packet Data (PD):
 - Data 0: 45h
 - Data 1: 00h (Always)
 - Error Correction Code (ECC)

This is defined on the Short Packet (SP) as follows.

DCS Read Short Response, 1 Byte Returned(DCSRR1-S)-Example

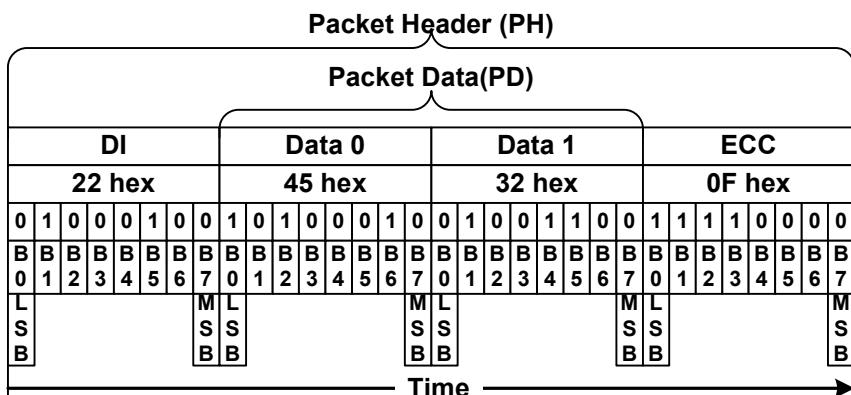

- DCS Read Short Response, 2 Bytes Returned (DCSRR2-S), Data Type = 10 0010(22h)

“DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 10 0010b), from the display module to the MCU. “DCS Read Short Response, 2 Bytes Returned” (DCSRR2-S) is used when the display module wants to response a DCS Read command, which the MCU has sent to the display module.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 10 0010b
- Packet Data (PD):
 - Data 0: 45h
 - Data 1: 32h
- Error Correction Code (ECC)

This is defined on the Short Packet (SPa) as follows.

DCS Read Short Response,2 Bytes Returned (DCSRR2-S) –Example

- Generic Read Long Response (GENRR-L), Data Type = 01 1010(1Ah)

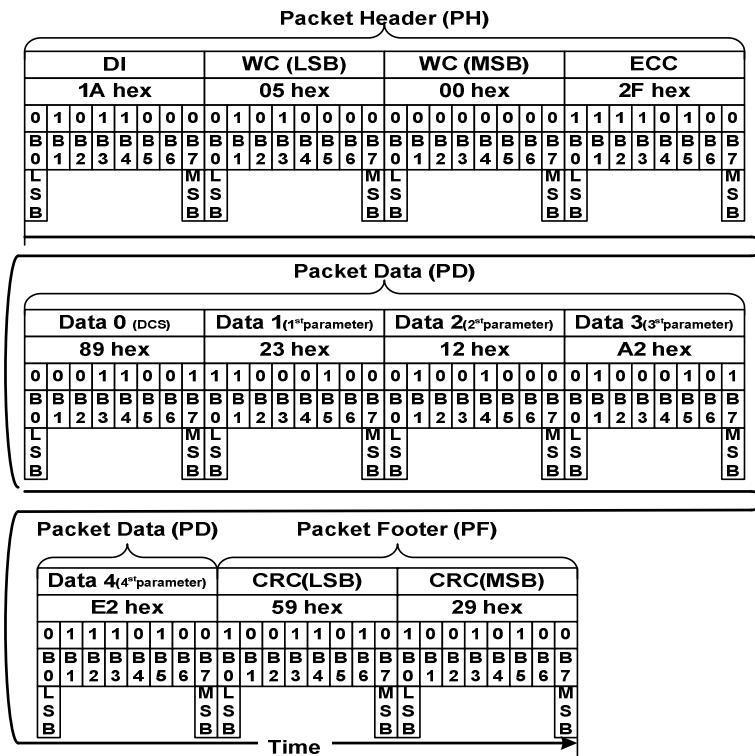

“Generic Read Long Response” (GENRR-L) is always using a Long Packet (LPa), what is defined on Data Type (DT, 01 1010b), from the display module to the MCU. “Generic Read Long Response” (GENRR-L) is used when the display module wants to response a Generic Read command, which the MCU has sent to the display module.

Long Packet (LPa), which includes 5 data bytes of the Packet Data (PD), is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 1010b
- Word Count (WC)

- Word Count (WC): 0005h
- Error Correction Code (ECC)
- Packet Data (PD):
 - Data 0: 89h
 - Data 1: 23h
 - Data 2: 12h
 - Data 3: A2h
 - Data 4: E2h
- Packet Footer (PF)

This is defined on the Long Packet (LP) as follows.

- Generic Read Short Response, 1 Byte Returned (GENRR1-S), Data Type = 01 0001(11h)

“Generic Read Short Response, 1 Byte Returned” (GENRR1-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0001b), from the display module to the MCU. “Generic Read Short Response, 1Byte Returned” (GENRR1-S) is used when the display module wants to response a Generic Read command,

which the MCU has sent to the display module.

Short Packet (SPa) is defined e.g.

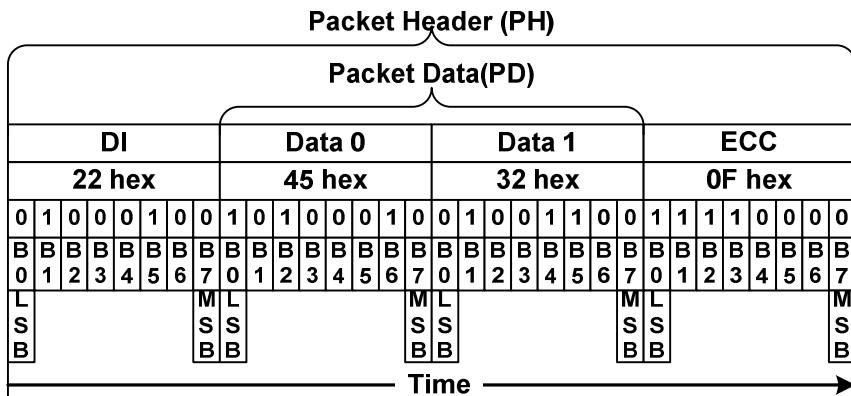

- Data Identification (DI)

- Virtual Channel (VC, DI[7...6]): 00b
- Data Type (DT, DI[5...0]): 01 0001b

- Packet Data (PD):

- Data 0: 45h
 - Data 1: 00h (Always)
 - Error Correction Code (ECC)

This is defined on the Short Packet (SP) as follows.

Generic Read Short Response,1 Byte Returned (GENRR1-S)-Example

- Generic Read Short Response, 2 Bytes Returned (GENRR2-S), Data Type = 01 0010(12h)

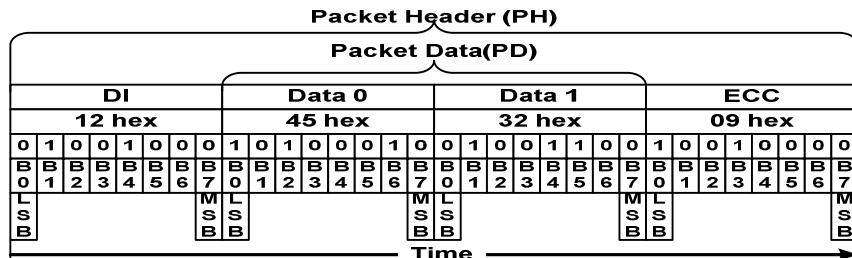

“Generic Read Short Response, 2 Bytes Returned” (GENRR2-S) is always using a Short Packet (SPa), what is defined on Data Type (DT, 01 0010b), from the display module to the MCU. “Generic Read Short Response, 2Bytes Returned” (GENRR2-S) is used when the display module wants to response a Generic Read command,

which the MCU has sent to the display module.

Short Packet (SPa) is defined e.g.

- Data Identification (DI)
 - Virtual Channel (VC, DI[7...6]): 00b
 - Data Type (DT, DI[5...0]): 01 0010b
 - Packet Data (PD):
 - Data 0: 45h
 - Data 1: 32h
 - Error Correction Code (ECC)

This is defined on the Short Packet (SP) as follows.

8.4. Communication Sequences

8.4.1 General

The communication sequences can be done on interface or packet levels between the MCU and the display module. See chapters “Interface Level Communication” and “Packet Level Communication”.

This communication sequence description is for DSI data lanes and it has been assumed that the needed low level communication is done on DSI clock lanes (DSI-CLK+/-) automatically.

Functions of the interface level communication is described on the following table.

Interface Mode	Abbreviation	Interface Action Description
Low Power	LP-11	Stop state
	LPDT	Low power data transmission
	ULPS	Ultra-Low power state
	RAR	Remote application reset
	TEE	Tearing effect event
	ACK	Acknowledge (No error)
	BTA	Bus turnaround
High Speed	HSDT	High speed data transmission

Interface Level Communication

Functions of the packet level communication are described on the following table.

Packet Sender	Abbreviation	Packet Size	Packet Description
MCU	DCSW1-S	SPa	DCS Write,1 Parameter
	DCSWN-S	SPa	DCS Write, No parameter
	DCSW-L	LPa	DCS Write,Long
	DCSRN-S	SPa	DCS Read,No Parameter
	SMRPS-S	SPa	Set maximum return packet size
	NP-L	LPa	Null packet, No data
Display Module	AwER	SPa	Acknowledge with error report
	DCSRR-L	LPa	DCS Read, Long Response
	DCSRR1-S	SPa	DCS Read, Short Response
	DCSRR2-S	SPa	DCS Read, Short Response

Packet Level Communication

8.4.2 Sequences

- DCS Write, 1 Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)” is defined on chapter

"Display Command Set (DCS) Write, 1 Parameter (DCSW1-S)" and example sequences, how this packet is used, is described on following tables.

DCS Write, 1 Parameter Sequence – Example 1

Line	MCU		Information Direction	Display Module		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	=>	-	-	Start
2	DCSW1-S	LPDT	=>	-	-	-
3	-	LP-11	=>	-	-	End

DCS Write, 1 Parameter Sequence – Example2

Line	MCU		Information Direction	Display Module		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	=>	-	-	Start
2	DCSW1-S	HSDT	=>	-	-	-
3	EoTP	HSDT	=>	-	-	End of Transmission Packet
4	-	LP-11	=>	-	-	End

DCS Write, 1 Parameter Sequence - Example 3

Line	MCU		Information Direction	Display Module		Comment

- DCS Read, No Parameter Sequence

A Short Packet (SPa) of “Display Command Set (DCS) Read, No Parameter (DCSRN-S)” is defined on chapter “Display Command Set (DCS) Read, No Parameter (DCSRN-S)” and example sequences, how this packet is used, is described on following tables.

DCS Read, No Parameter Sequence – Example 1

Line	MCU		Information Direction	Display Module		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	=>	-	-	Start
2	SMRPS-S	HSDT	=>	-	-	Define how many data byte is wanted to read: 1 byte
3	DCSRN-S	HSDT	=>	-	-	Wanted to get a response ID1 (DAh)
4	EoTP	HSDT	=>	-	-	End of Transmission Packet
5	-	LP-11	=>	-	-	-
6	-	BTA	<=>	BTA	-	Interface control change from the MCU to the display module
7	-	-	<=	LP-11	-	If no error=>goto line 9 If error=> goto line 14 If error is corrected by ECC =>go to line 19
8	-	-	-	-	-	-
9	-	-	<=	LPDT	DCSRR1-S	Responded 1 byte return
10	-	-	<=	LP-11	-	-
11	-	BTA	<=>	BTA	-	Interface control change from the Display module to the MCU
12	-	LP-11	=>	-	-	End
13	-	-	-	-	-	-
14	-	-	<=	LPDT	AwER	Error report
15	-	-	<=	LP-11	-	-
16	-	BTA	<=>	BTA	-	Interface Control change from the Display module to the MCU
17	-	LP-11	=>	-	-	End
18	-	-	-	-	-	-
19	-	-	<=	LPDT	DCSRR1-S	Responded 1 byte return
20	-	-	<=	LPDT	AwER	Error Report (Error is Corrected by ECC)

21	-	-	<=	LP-11	-	-
22	-	BTA	<=>	BTA	-	Interface control change from the display module to the MCU
23	-	LP-11	=>	-	-	End

- Null Packet, No Data Sequence

A Long Packet (LPa) of “Null Packet, No Data (NP-L)” is defined on chapter “Null Packet, No Data (NP-L)” and example sequences, how this packet is used, is described on following tables.

Null Packet, No Parameter Sequence - Example

Line	MCU		Information Direction	Display Module		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	=>	-	-	Start
2	NP-L	HSDT	=>	-	-	Only high speed data transmission Is used
3	EoTP	HSDT	=>	-	-	End of Transmission Packet
4	-	LP-11	=>	-	-	End

- End of Transmission Packet

A Short Packet (SPa) of “End of Transmission (EoT)” is defined on chapter “End of Transmission Packet (EoT)” and an example sequences, how this packet is used, is described on following tables.

End of Transmission Packet – Example

Line	MCU		Information Direction	Display Module		Comment
	Packet Sender	Interface Mode Control		Interface Mode Control	Packet Sender	
1	-	LP-11	=>	-	-	Start
2	NP-L	HSDT	=>	-	-	Only high speed data transmission Is used
3	EoTP	HSDT	=>	-	-	End of Transmission Packet
4	-	LP-11	=>	-	-	End

8.4.3 Video Mode Communication

Video Mode peripherals require pixel data delivered in real time. This section specifies the format and timing of DSI traffic for this type of display module.

8.4.3.1 Transmission Packet Sequences

DSI supports several formats, or packet sequences, for Video Mode data transmission. The peripheral's timing requirements dictate which format is appropriate. In the following sections, Burst Mode refers to time-compression of the RGB pixel (active video) portion of the transmission. In addition, these terms are used throughout the following sections:

- Non-Burst Mode with Sync Pulses – enables the peripheral to accurately reconstruct original video timing, including sync pulse widths.
- Non-Burst Mode with Sync Events – similar to above, but accurate reconstruction of sync pulse widths is not required, so a single Sync Event is substituted.
- Burst mode – RGB pixel packets are time-compressed, leaving more time during a scan line for LP mode (saving power) or for multiplexing other transmissions onto the DSI link.

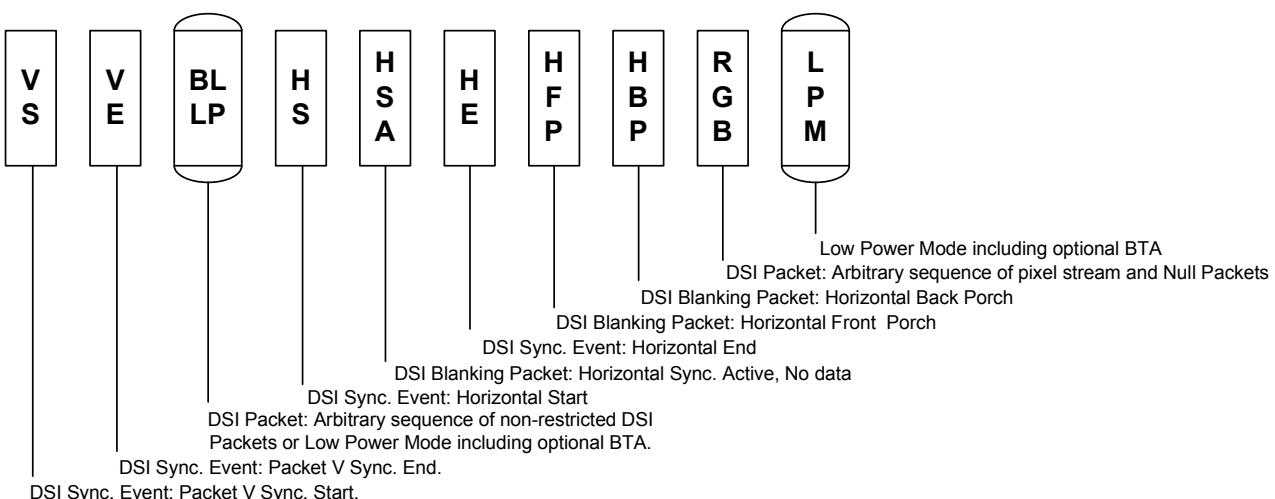

In the following figures the Blanking or Low-Power Interval (BLLP) is defined as a period during which video packets such as pixel-stream and sync event packets are not actively transmitted to the peripheral. To enable PHY synchronization the host processor should periodically end HS transmission and drive the Data Lanes to the LP state. This transition should take place at least once per frame; shown as LPM in the figures in this section. It is recommended to return to LP state once per scan-line during the horizontal blanking time.

Regardless of the frequency of BLLP periods, the host processor is responsible for meeting all documented peripheral timing requirements. Note, at lower frequencies BLLP periods will approach, or become, zero, and burst mode will be indistinguishable from non-burst mode.

During the BLLP the DSI Link may do any of the following:

- Remain in Idle Mode with the host processor in LP-11 state and the peripheral in LP-RX
- Transmit one or more non-video packets from the host processor to the peripheral using Escape Mode
- Transmit one or more non-video packets from the host processor to the peripheral using HS Mode
- If the previous processor-to-peripheral transmission ended with BTA, transmit one or more packets from the peripheral to the host processor using Escape Mode
- Transmit one or more packets from the host processor to a different peripheral using a different Virtual Channel ID The sequence of packets within the BLLP or RGB portion of a HS transmission is arbitrary. The host processor may compose any sequence of packets, including iterations, within the limits of the packet format definitions. For all timing cases, the first line of a frame shall start with VS; all other lines shall start with HS. This is also true in the special case when VSA+VBP=0. Note that the position of synchronization packets, such as VS and HS, in time is of utmost importance since this has a direct impact on the visual performance of the display panel. Normally, RGB pixel data is sent with one full scan line of pixels in a single packet. If necessary, a horizontal scan-line of active pixels may be divided into two or more packets. However, individual pixels shall not be split across packets.

Transmission packet components used in the figures in this section are defined in Figure below unless otherwise specified.

DSI Video Mode Interface Timing Legend

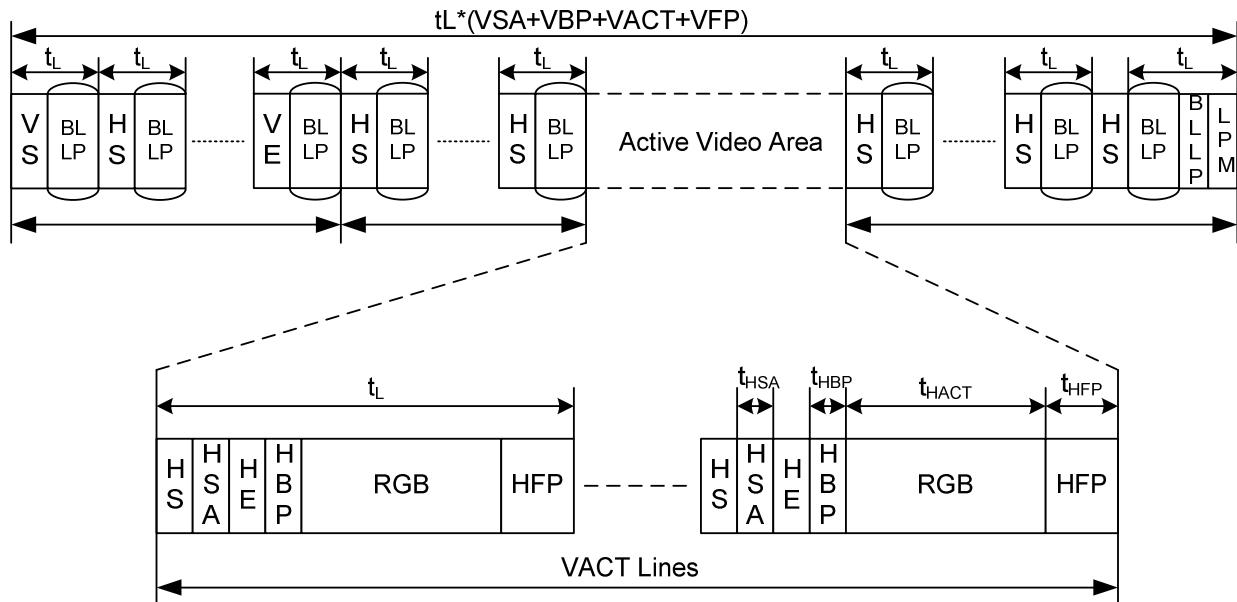

If a peripheral timing specification for HBP or HFP minimum period is zero, the corresponding Blanking Packet may be omitted. If the HBP or HFP maximum period is zero, the corresponding blanking packet shall be omitted.

There are two limitation for MIPI Video mode 2 Lane:

- (1) The packet number for H-porch or 1-line data should be even.
- (2) Packet Pixel Stream should be start at Lane0.

8.4.3.2 Non-Burst Mode With Sync Pulses

With this format, the goal is to accurately convey DPI-type timing over the DSI serial Link. This includes matching DPI pixel-transmission rates, and widths of timing events like sync pulses. Accordingly, synchronization periods are defined using packets transmitting both start and end of sync pulses. An example of this mode is shown in Figure below.

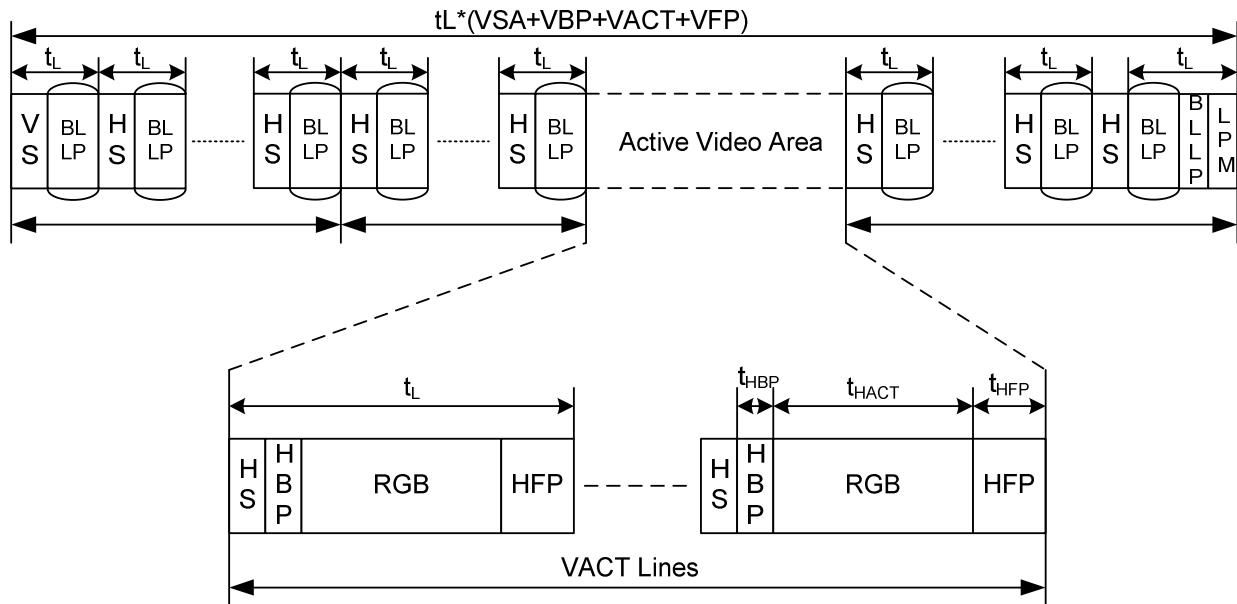

DSI Video Mode Interface Timing: Non-Burst Transmission with Sync Start and End

Normally, periods shown as HSA (Horizontal Sync Active), HBP (Horizontal Back Porch) and HFP (Horizontal Front Porch) are filled by Blanking Packets, with lengths (including packet overhead) calculated to match the period specified by the peripheral's data sheet. Alternatively, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

8.4.3.3 Non-Burst Mode

This mode is a simplification of the format described in section 5.3.2.4.2 “Non-Burst Mode with Sync Pulse”. Only the start of each synchronization pulse is transmitted. The peripheral may regenerate sync pulses as needed from each Sync Event packet received. Pixels are transmitted at the same rate as they would in a corresponding parallel display interface such as DPI-2.

An example of this mode is shown in Figure below.

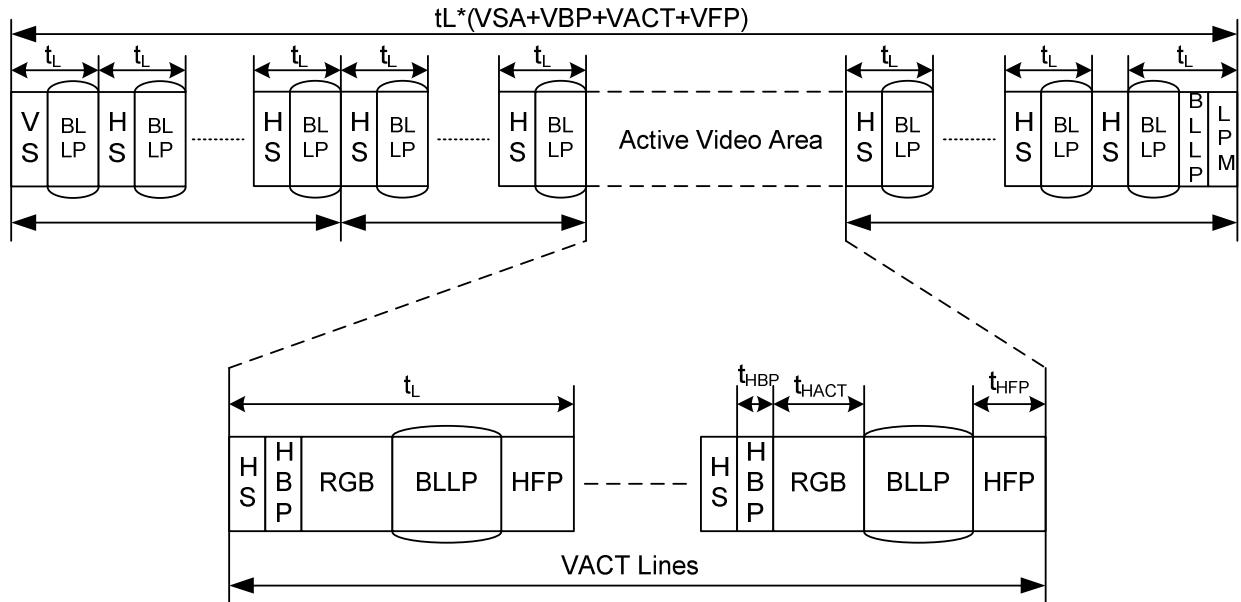

DSI Video Mode Interface Timing: Non-burst Transmission

As with the previous Non-Burst Mode, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

8.4.3.4 Burst Mode

In this mode, blocks of pixel data can be transferred in a shorter time using a time-compressed burst format. This is a good strategy to reduce overall DSI power consumption, as well as enabling larger blocks of time for other data transmissions over the Link in either direction. There may be a line buffer or similar memory on the peripheral to accommodate incoming data at high speed. Following HS pixel data transmission, the bus goes to Low Power Mode, during which it may remain idle, i.e. the host processor remains in LP-11 state, or LP transmission may take place in either direction. If the peripheral takes control of the bus for sending data to the host processor, its transmission time shall be limited to ensure data underflow does not occur from its internal buffer memory to the display device.

An example of this mode is shown in Figure below.

DSI Video Mode Interface Timing: Burst Transmission

Similar to the Non-Burst Mode scenario, if there is sufficient time to transition from HS to LP mode and back again, a timed interval in LP mode may substitute for a Blanking Packet, thus saving power.

9. POWER DEFINITION

9.1. Power Level

5 level modes are defined they are in order of Maximum Power consumption to Minimum Power Consumption

1. Normal Mode On (full display), Idle Mode Off, Sleep Out.

In this mode, the display is able to show maximum 16.7M colors.

2. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 8 colors.

3. Normal Mode On (full display), Idle Mode On, Sleep Out.

In this mode, the full display area is used but with 2 colors.

4. Sleep In Mode

In this mode, the DC: DC converter, internal oscillator and panel driver circuit are stopped. Only the MCU interface and memory works with VCI power supply. Contents of the memory are safe.

5. Power Off Mode

In this mode, both VCI and VDDI are removed.

Note: Transition between modes 1-4 is controllable by MIPI commands. Mode 6 is entered only when both Power supplies are removed.

9.2.. Power ON/OFF Sequence

VDDI and VCI can be applied in any order.

VCI and VDDI can be power down in any order.

During power off, if LCD is in the Sleep Out mode, VCI and VDDI must be powered down minimum 120msec after RESX has been released.

During power off, if LCD is in the Sleep In mode, VDDI or VCI can be powered down minimum 0msec after RESX has been released.

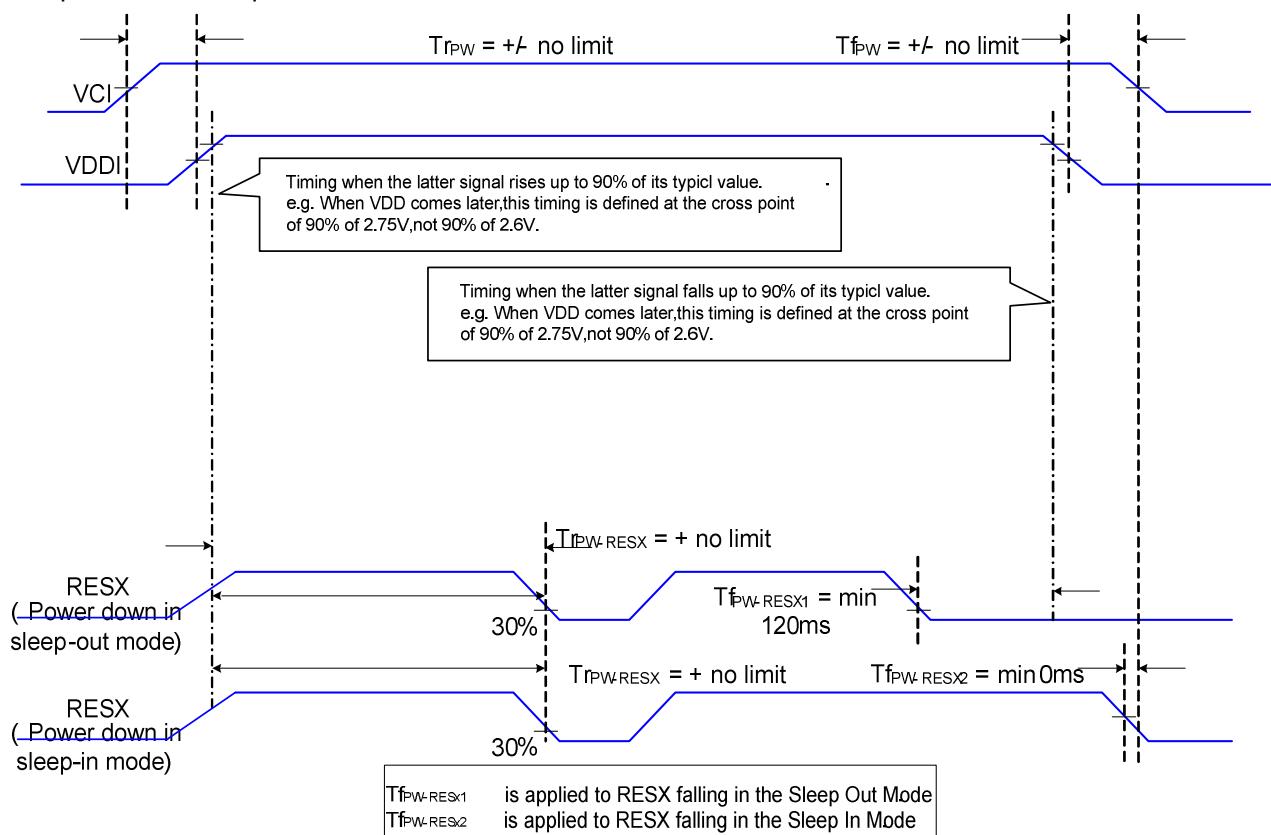

Note 1: There will be no damage to the display module if the power sequences are not met.

Note 2: There will be no abnormal visible effects on the display panel during the Power On/Off Sequences.

Note 3: There will be no abnormal visible effects on the display between end of Power On Sequence and before receiving Sleep Out command. Also between receiving Sleep In command and Power Off Sequence.

Note 4: If RESX line is not held stable by host during Power On Sequence as defined in the sequence below, then it will be necessary to apply a Hardware Reset (RESX) after Host Power On Sequence is complete to ensure correct operation. Otherwise function is not guaranteed.

The power on/off sequence is illustrated below

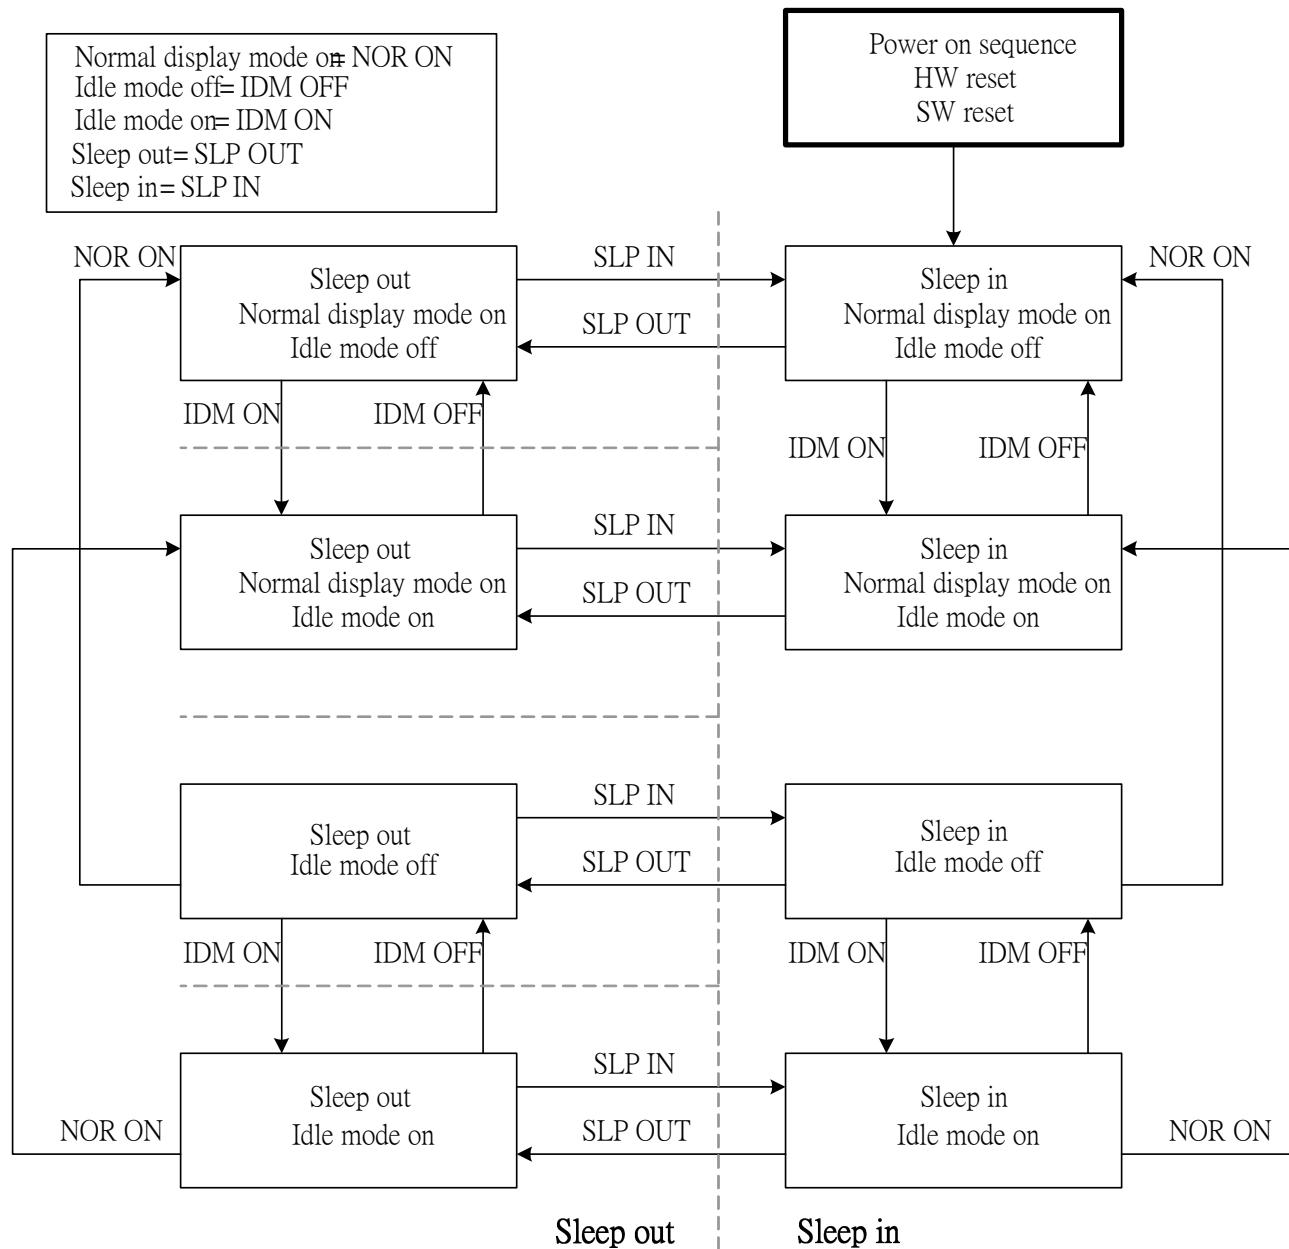

9.3.. Uncontrolled Power OFF

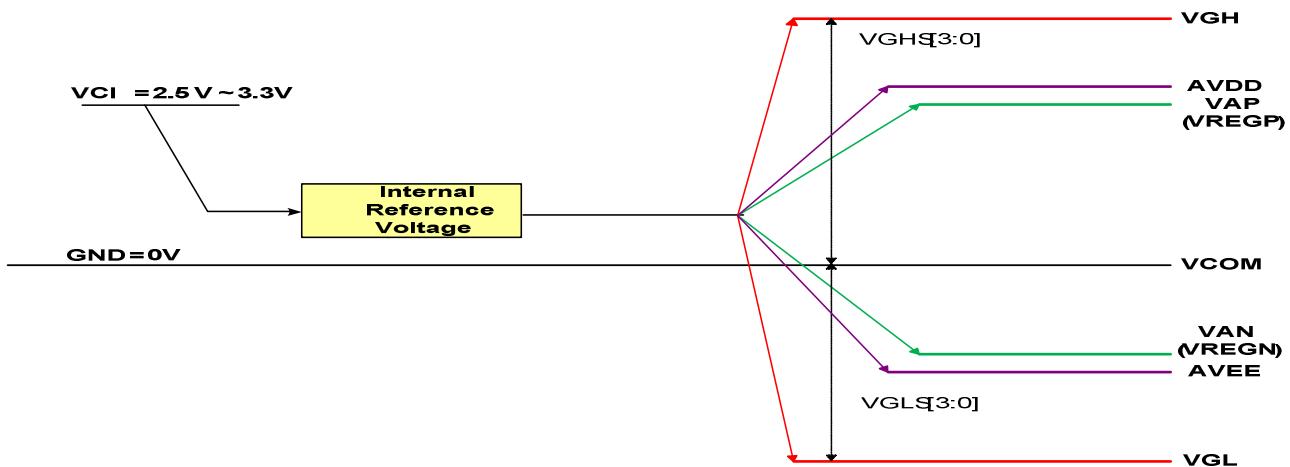

The uncontrolled power-off means a situation which removed a battery without the controlled power off sequence. It will neither damage the module or the host interface.

If uncontrolled power-off happened, the display will go blank and there will not any visible effect on the display (blank display) and remains blank until "Power On Sequence" powers it up.

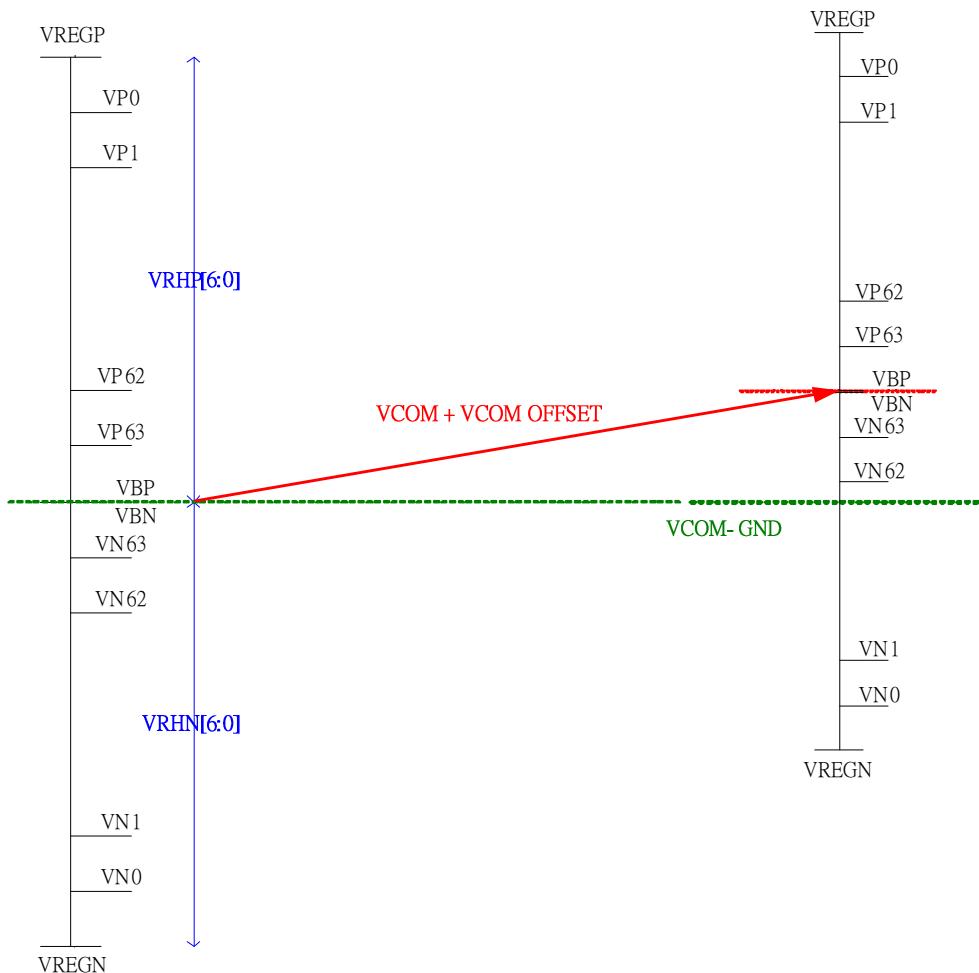

9.4.. Power Flow Chart

9.5.. Voltage Generation

9.6.. Relationship about source voltage

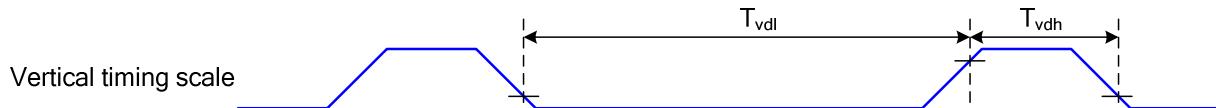

10. FUNCTION DESCRIPTION

10.1. Tearing Effect

The Tearing Effect output line supplies to the MPU a Panel synchronization signal. This signal can be enabled or disabled by the Tearing Effect Line Off & On commands. The mode of the Tearing Effect signal is defined by the parameter of the Tearing Effect Line On command. The signal can be used by the MPU to synchronize Frame Memory Writing when displaying video images.

10.1.1 Tearing effect line modes

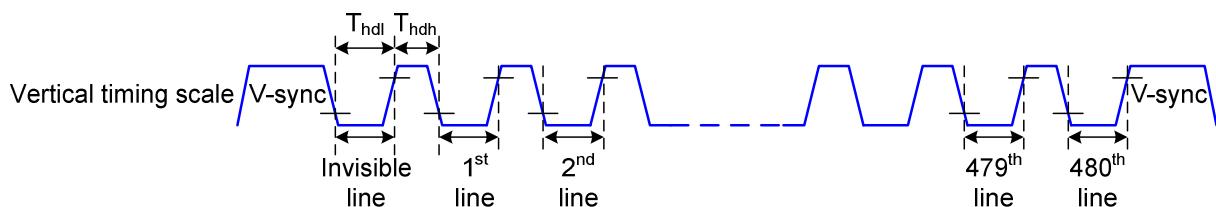

Mode 1, the Tearing Effect Output signal consists of V-Blanking Information only:

$tvdh$ = The LCD display is not updated from the Frame Memory

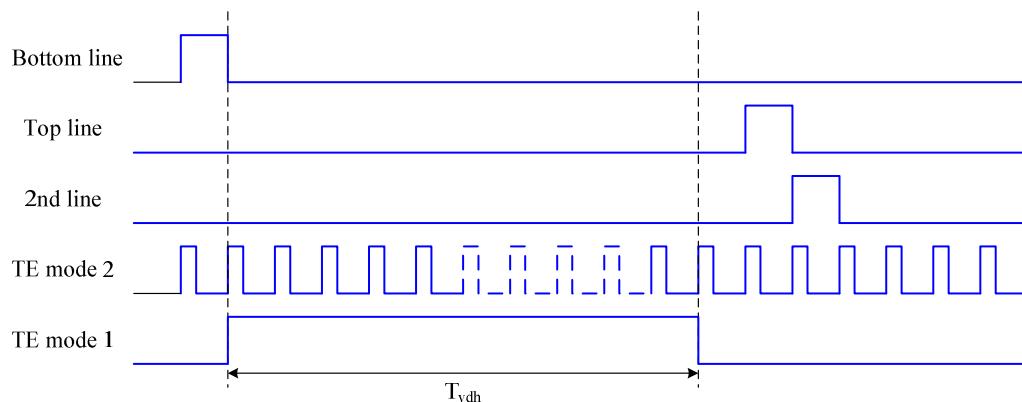

$tvdl$ = The LCD display is updated from the Frame Memory (except Invisible Line – see above)

Mode 2, the Tearing Effect Output signal consists of V-Blanking and H-Blanking Information, there is one V-sync and 320 H-sync pulses per field.

$thdh$ = The LCD display is not updated from the Frame Memory

$thdl$ = The LCD display is updated from the Frame Memory (except Invisible Line – see above)

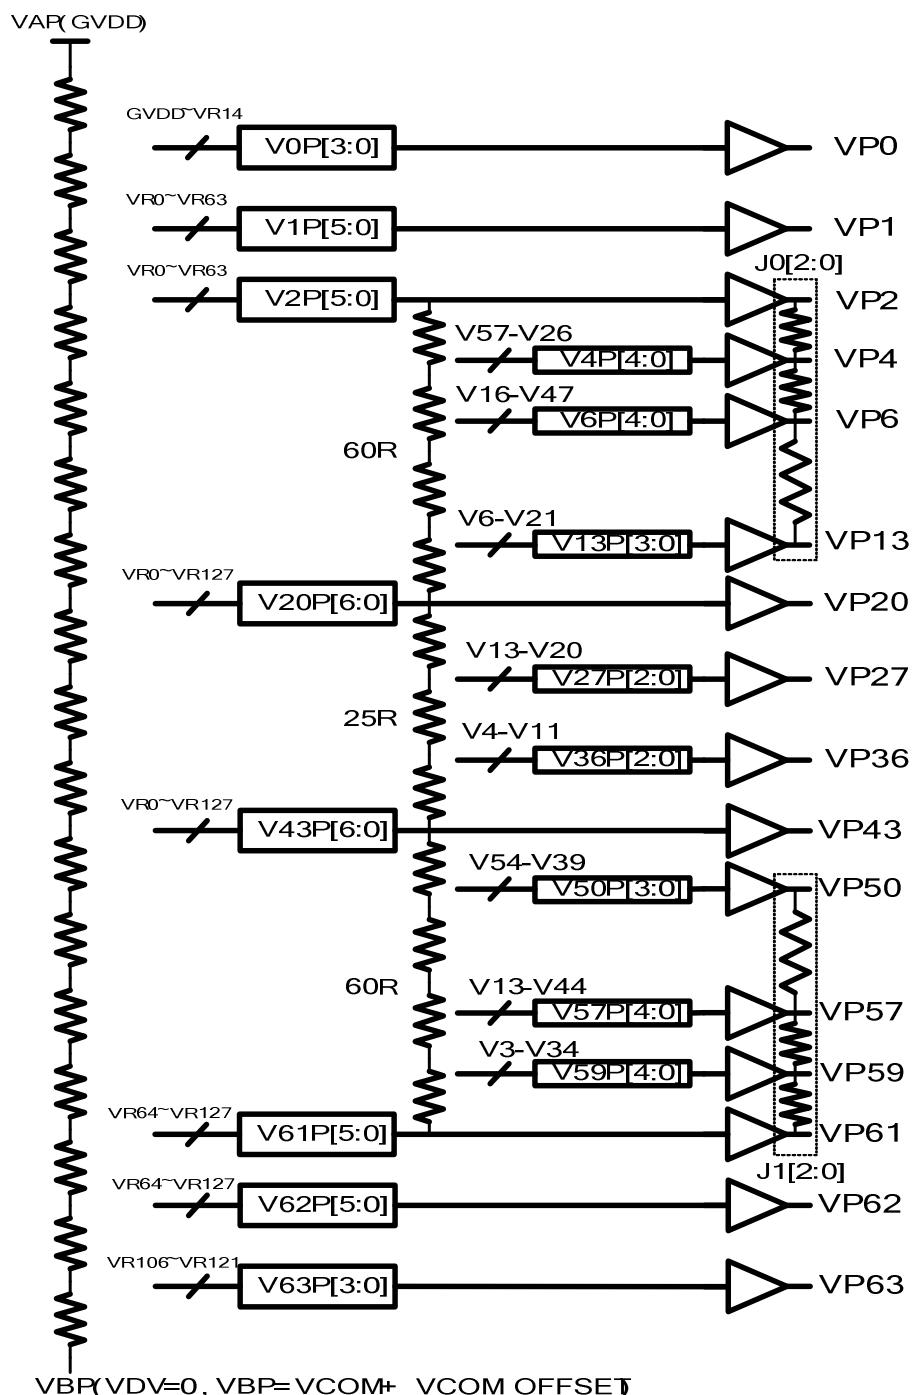

Note: During Sleep In Mode, the Tearing Output Pin is active Low.

10.2. Gamma Correction

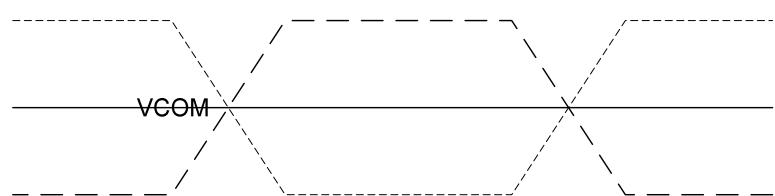

ST7796DW incorporate the gamma correction function to display 16.7M colors for the LCD panel. The gamma correction is performed with 3 groups of registers, which are gradient adjustment, contrast adjustment

and fine- adjustment registers for positive and negative polarities, and RGB can be adjusted individually.

Gray scale Voltage Generation (Positive)

Source Driver Output

Relationship between Source Output and VCOM

Percentage adjustment:

VJ0P[2:0], VJ1P[2:0], VJ0N[2:0], VJ1N[2:0] these register are used to adjust the voltage level of interpolation point. The following table is the detail description.

- SLPOUT (11h): Sleep Out

SLPOUT (Sleep Out)													
11H	D/CX	WRX	RDX	D17-8	D7	D6	D5	D4	D3	D2	D1	D0	HEX
SLPOUT	0	↑	1	-	0	0	0	1	0	0	0	1	(11h)
parameter	No Parameter												
Description	-This command turn off sleep mode. -In this mode the DC/DC converter is enabled, internal display oscillator is started, and panel scanning is started.												
Restriction	-This command has no effect when module is already in sleep out mode. Sleep out mode can only be left by the sleep in command (10h). -It will be necessary to wait 5msec before sending any new commands to a display module following this command to allow time for the supply voltages and clock circuits to stabilize. -It will be necessary to wait 120msec after sending sleep out command (when in sleep in mode) before sending an sleep in command. -The display module runs the self-diagnostic functions after this command is received.

WRMEMC	0	↑	1	-	0	0	1	0	1	1	0	0	(2Ch)
1 st parameter	1	↑	1	-	D1.7-0								
:	1	↑	1	-	Dx.7-0								
N th parameter	1	↑	1	-	Dn.7-0								
Description	<p>-This command transfers image data from the host processor to the display module's frame memory continuing from the pixel location following the previous write memory continue or memory write command.: Data is written continuing from the pixel location after the write range of the previous memory write or write memory continue. The column register is then incremented and pixels are written to the frame memory until the column register equals the end column (XE) value. The column register is then reset to XS and the page register is incremented. Pixels are written to the frame memory until the page register equals the end page (YE) value and the column register equals the XE value, or the host processor sends another command. If the number of pixels exceeds (XE-XS+1)*(YE-YS+1) the extra pixels are ignored.</p>												

	Condition	Column	Page												
	Command 2C is accepted	Return to "Start Column"	Return to "Start Page"												
	Read/Write RAM action	Increment by 1	No change												
	Column value is large than "End Column"	Return to "Start Column"	Increment by 1												
	Page value is large than "End Page"	Return to "Start Column"	Return to "Start Page"												
Restriction	<i>A memory write should follow a column address set or page address set to define the write address. Otherwise, data written with write memory continue is written to undefined addresses.</i>
